A lot of electronics manufacturers don't give out schematics to keep the competition guessing. The days of opening something up and fixing it yourself are nearly gone for a lot of things.

Aside from what John said, you likely stressed a lot
of other components in the scanner. It would be best
to send it to Uniden for repair (or replacement).

You can get it to working condition only to have
another issue come up a month or two later.

Joe M.

John Stark wrote:

I'm lost I been doing electronics for almost 40 years and have seen a lot
of changes, but , tell me ....how do you accidently drop 28v(ac/dc) on a
little ol 6v????
much less how did it get that high in the first place.
they are absolutely correct about the sams it is almost impossible to get
them unless you are a tech for that particular product.

Plug the wrong supply in could have done it.
I'm still trying to figure out how you crack a cap though as that just shouldn't happen. Even soldering them shouldn't do that unless using a soldering iron that's way too hot. With today's electronics much of the solder used doesn't need much heat compared to 15 years ago. But then with all the SMT technology that makes sense as the parts can't take the heat of soldering the old parts did.

8115. Re: [BCD396XT] Power Issues

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-07-05 02:34:13 UTC
From: chris451
Topic: 8111 Message: 8115

Yes it was an OOOOPS.
I had a dual bench supply and was testing something else, slipped. The 2nd half was set to 24v, but current limited, but there's enough energy in capacitors to put a failure spike on the other supply line.

Re Chip caps. They are wonderfully small but terribly fragile.

ON my numerous radios and scanners, the #1 failure is poor sensitivity. This was found to be due to the input connector solder cracking, or stress on the
first RF coupling capacitor into the board. I keep 2 of each. Side by side one is fine and as expected and the other will have variable sensitivity, or it will change when the antenna is stressed.

Usually the bad capacitor will fall into two parts when one end is unsoldered.
One of the capacitor vendors of SMD parts has said
direct contact with a soldering iron will cause microcracks.
Freezing or stress will cause the part to split.
To fix it, I try to put a stress loop on the antenna connection, and make sure the connector
is tight.
For the capacitor, I try not to touch the part except with tweezers, and reflow the adjacent solder
rather than direct on the part.

This problem has been found on handheld scanners or trancievers that I have owned.
Brands I use: Icom, Uniden, Motorola. I have never had to fix a Motorola for that problem.
A similar problem seems to recur on laptop power cords. See how Dell has addressed that on the D620--d820 laptops. Small inner conductor made of silver eliminates center pin stress.

A good rule would be to make sure your antenna never touches anything that stresses it.
Belt clips are the enemy of your product, as when you sit down extreme stress can occur.
Antenna connections seem to be the first thing that breaks.

Design wise, a larger SMD part does better than a smaller SMD part, so stay away from an 0402 or 0201 part where there will be mechanical stress.
That is a hard lesson many have not learned.

There are people like me that don't like the downtime and just fix most things myself.
The radio was down for 3 days while the amp chip was sent and I had the

zener already.
I think I had to fix the antenna on that unit as well, but I've quit using belt clips or make sure to take it off before sitting in a car.
I just feed it batteries from my rechargeable stockpile of AA's.
I remember sending one of the bct396t into Uniden before and it was a couple of weeks and 80-90 bucks, before I got it back.

I've seen another person on this list complain about not picking up aircraft.

His unit could have a broken antenna connection so he can still get 800mhz but that would degrade at VHF bands. The best thing is check it with a signal generator

here's what I get on "good units"

.5uv open .25uV close on a good uniden. 163.5mhz.
.35 open .20uV close on an icr20

am
.28uv open .20uv close max squelch open 0.562uV on bct396xt am band 121.5mhz.
.15uv open .10uv close ic-r20

Well I certainly hope UPman can help. I haven't seen anyone else ask that question.
Here's another question. I'll just figure it out.

Lets say I have a quick key programmed for a system. Under that system I have 10 banks defined.
As I press shift and a number, I get sr1, sr2, sr3 ... gps (as a secondary mark on the keys).
That shift + a number used to turn the groups on or off.
I get a star for an off group and a number for an on group. But holding Func and pressing a key immediately produces the function marked below and to the right of the buttons.
So my question is how do I turn the groups on and off other than navigating through the menu to the group lock/unlock? Sometimes I can change that while scanning, but its not always the case.
Oh I figured it out.
Scan the quick key (for example 1 with groups 0 to 9 defined.) Hold func. key till it locks to that system and F key holds without being pressed. This does a system hold and enables banknumber keys. In this mode press a number to turn a group on or off.
If having trouble getting F hold to stop on a system increase the hold time to 10 seconds.
I'm sure its in the manual but hard to remember.

Always forget this one.

8116. 396Xt Display Light

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-07-06 12:32:21 UTC
From: glg-swl7687@...
Topic: 8116 Message: 8116

Hello,

If I recall correctly at first press of On/Off button - beep - the display light is on. It shows the welcome screen. Is this normal?

If above is correct, how do I reset my radio? My unit's light is not on at startup?

After the unit is on - running - scanning - a press of the On/Off button does light up correctly.

What I have tried:

1) Reset - Turn off scanner - Press2, 9, hold while turing it on.
2) Loaded Flash memory via BC_VUP_V3 -- Firmware 1-11-01

Thanks for your comments.

Greg

With mine, the light has never come up when it's turned on.

At 08:32 AM 7/6/2013, you wrote:

"light on" at start is not the default setting.
 Welcome screen is normal
otherwise appears normal ... light on when pressed when already powered up..

I work in electric rail car maintenance and everything we have is serial. Just because cheap home PCs don't include serial ports anymore doesn't mean it's not used.

8120. BCD396XT BC250

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-07-07 23:09:29 UTC
From: zoykz
Topic: 8120 Message: 8120

Hello, good people. I bought a new BCD396XT and I can't stop using it. I'm so happy Uniden has gone to regular batteries instead of the expensive proprietary batteries with the wires and plug! I have a Uniden BC250 that has TEN "search ranges" and I'm wondering if my BCD396XT has the same feature and I was wondering if some kind soul could tell me how to access this feature. Does Uniden still call it "search ranges"? The BC250 menu is MENU/BACK button, SERVICE OPTION, CHAIN SEARCH, SEARCH RANGE. You could create 10 separate search ranges. It was real handy for keeping on top of many frequencies. Thanks for any help.

I too am very happy for the standard cells.

The XT has the same feature with the same name.

MENU
SEARCH FOR
EDIT CUSTOM (or select CUSTOM SEARCH once programmed)
Select the slot (1-10)
Edit the limits, etc.

Once you are done setting things up, 'back out' of that menu step using
the MENU button and select CUSTOM SEARCH.

Thanks for your help. But now only more questions pop up. Sorry for trying your patience. A constant fear of mine is that I'm paying full price for a 396 that was USED and returned. Radio Shack flat out sold me a 396 and it clearly had been used and programmed although they sold it at full price. They fought me on the return. A trip to Fry's resulted in just two left with one sold as used and the other as new. I bought the new. Problem #1: I went from MENU to SEARCH FOR... to EDIT CUSTOM and punched in my upper and lower frequencies and backed out. I turned it off to take a breather. I turned it back on and went to CUSTOM SEARCH and it just sticks on CUSTOM 10 even though I chose CUSTOM 1 as the place for my lower and upper frequencies. I can't get it to go to CUSTOM 1 even though I turn the knob to manipulate the up and down arrows. How does one does this? (On my old BC250 I just punched in the numbers on the keyboard to get the corresponding "scan range".) Problem #2: However, on CUSTOM 10 of my 396 I see "959.9625MHz". I never created the CUSTOM 10 and I certainly did not punch in "959.9625MHz" So does this mean that a previous user of my fine 396 created this "CUSTOM 10"?? Was I sold a used 396? I just punched a number on the keyboard and the 396 went from "959.9625MHz" is to "946.1375MHz". So I someone has previously owned my "new" 396? I really don't know how to present this to Fry's to get a refund, LOL. It's way beyond their 30 day return policy. I'd be grateful if you could please tell me how I could access my CUSTOM 1 so I could at least listen to my frequencies as I ponder my alleged rip-off, LOL. Thanks.

There are preprogrammed search ranges in all scanners.

To disable slot 10 and enable slot 1 just do the same as
you did on your 250 - hit the 1 key then the 0 (10) key.

My BC250 had NO frequencies stored in the ONE thru TEN scan search channels so I can't quite get what you are saying. But once you program your low and high frequencies into CUSTOM 1 in your 396, how do you get back to CUSTOM 1 to listen to it? I tried pressing 1 and nothing happened. My new 396 just seems to go to any CUSTOM range it wants.

Our new electric rail cars in Sydney are all networked and can be
fully accessed anywhere on the the train. In fact, during testing, we
connected a Wifi router to the network, and all the equipment could be
monitored and modified from iPads.

Were you in CUSTOM SEARCH mode when you hit the 1 key?

You should be able to enable/disable
all 10 slots when you are in that mode.

From: Uniden UPMan
Topic: 8124 Message: 8129

All the search ranges are preprogrammed with some default values at the factory. The scanner is also preprogrammed with some default systems at the factory. That there are values already set for these settings is not evidence of prior ownership.

>Thanks for your help. But now only more questions pop up. Sorry for trying your patience. A constant fear of mine is that I'm paying full price for a 396 that was USED and returned. Radio Shack flat out sold me a 396 and it clearly had been used and programmed although they sold it at full price. They fought me on the return. A trip to Fry's resulted in just two left with one sold as used and the other as new. I bought the new. Problem #1: I went from MENU to SEARCH FOR... to EDIT CUSTOM and punched in my upper and lower frequencies and backed out. I turned it off to take a breather. I turned it back on and went to CUSTOM SEARCH and it just sticks on CUSTOM 10 even though I chose CUSTOM 1 as the place for my lower and upper frequencies. I can't get it to go to CUSTOM 1 even though I turn the knob to manipulate the up and down arrows. How does one does this? (On my old BC250 I just punched in the numbers on the keyboard to get the corresponding "scan range".) Problem #2: However, on CUSTOM 10 of my 396 I see "959.9625MHz". I never created the CUSTOM 10 and I certainly did not punch in "959.9625MHz" So does this mean that a previous user of my fine 396 created this "CUSTOM 10"?? Was I sold a used 396? I just punched a number on the keyboard and the 396 went from "959.9625MHz" is to "946.1375MHz". So I someone has previously owned my "new" 396? I really don't know how to present this to Fry's to get a refund, LOL. It's way beyond their 30 day return policy. I'd be grateful if you could please tell me how I could access my CUSTOM 1 so I could at least listen to my frequencies as I ponder my alleged rip-off, LOL. Thanks.
>
>My BC250 had NO frequencies stored in the ONE thru TEN scan search channels so I can't quite get what you are saying. But once you program your low and high frequencies into CUSTOM 1 in your 396, how do you get back to CUSTOM 1 to listen to it? I tried pressing 1 and nothing happened. My new 396 just seems to go to any CUSTOM range it wants.

It sounds to me like you have forgotten that Uniden pre-programs all
of it's new scanners at the factory before they are shipped out.

Here is what I did on my 396: I went to MENU, SEARCH FOR..., CUSTOM SEARCH. CUSTOM 1 appears and the low-high frequencies that I programmed take off with great speed from low to high and then it stops. I would expect my 396 to reverse itself automatically and either go back from high to low or restart at low and go back to high. But it doesn't. It just hangs. I did get a few very clear transmissions when it went racing from low to high, but that's all.

With my BC250 I programmed my desired frequencies in all 10 slots and to access the slots I would punch "SEARCH" and then any number from 1 to 10 on the keypad and my 250 would scan the frequencies from low to high and then restart at low gain. When it hit a frequency I wanted to listen to I would punch "HOLD/MAN" and if it stopped on a frequency I didn't care for, usually the ones that have sound effects from hell, I punched "RSM" or "L/O".

This is how my brain is programmed. I look for familiar functions and settings. This is why I would cry myself to sleep learning the ICOM R-20.When explanations are given and I cannot make the jump in logic I get stymied. I expect my 396 to be just like my 250.

Thank you for telling me. That's a new one. I guess Uniden programs the scanners for people who have no idea on who to listen to. I, on the other hand, have a very, very good idea on what I want to hear.

Again, your 396T will work the same way except that where the 296 may
have only been able to search one range at a time (I don't recall), the
396 can search any of the slots in sequence.

If it is hanging on a frequency, you can hit lockout and it will lock
that frequency out of the search. If you hit the lockout button once, it
will temporarily lock it out. If you hit it twice, it will permanently
lock it out.

Like your 296, the search will start low and to go the high frequency,
and start over when it reaches the end of the enabled slot(s).

Oh, and the HOLD button works the same, too.

8135. RE: [BCD396XT] New YahooGroups for the newer Uniden Scanner Models

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-07-09 08:05:21 UTC
From: Beauregard Waller
Topic: 8003 Message: 8135

Then why have computers required serial drivers for their serial devices? Maybe dedicated hardware do not need drivers, maybe, since they are dedicated to one task, they have the equivalence of drivers designed into their hardware. Whereas programmable devices would lose flexibility by having the drivers hardwired so they are supplied by software. A computer needs drivers to translate to/from the serial port to the computer code of the chips/os, et al. That is why, roughly, all i/o needs drivers. No one can argue that Ethernet is not a standard, yet it needs drivers to be useful, same thing for sata and pata.

Saying, “If USB was truly universal, there would be no need for host devices and drivers.” Does not even make sense. Why would needing host devices and drivers mean it is not universal?? The test of the universality of some things is not how it is built or implemented, but is it used universally, and USB is used universally, therefore it is a universal standard. Just because it is an universal standard does not mean that there cannot be other universal standards, such as Ethernet, serial ports, parallel ports, et al. And actually, serial ports as you describe, maybe have a universal standard, but they are no longer a universal device. They are found only in special use environments, and old computers. The disadvantage of the old serial ports was that you could not plug more than on device in without a switch to select between the devices. USB is a serial device, but, you might say, the next generation. It allows you to plug multiple devices into one port which is why it has host devices. A system that is dedicated to one function can live with the old serial port, because you are not going to plug it into a different device, it is a fixed connection that will not change. But look at our computers, we have printers, hds, optical drives, optical scanners, radio scanners, music players, cameras, et al, all plugged into our computers via a serial port. You cannot do this with the old serial device, you would have to have a half dozen or more serial cards in order to do all we can do with USB.

<DaveL> If USB was truly universal, there would be no need for host devices and drivers.

I operate multi-million $$$ machinery that is programmed using Serial Protocol only. Even the Electric Fork Trucks are serial.

No need for drivers and host devices. Serial is a STANDARD. No support needed for compatibility with various OSs. Believe or not, Serial Protocol is not going anywhere, especially for manufacturing machinery.

"Again"? You got an attitude? Look, if you just give half-assed answers and cop an attitude then I prefer that you don't respond to my questions. We are all here for each other to help each other. In other forums I've gone a long way to help people when even Microsoft couldn't help them.
Are you purposely doing this and think it's funny? I never said anything about a "296". We are all adults here, get it straight. I'm not going to lockout a frequency when it's the fault of the 396. That would be stupid. I said the 396 started low and went high and it sticks on high. Read what I write. And I'll say it one more time, the 396 doesn't "start over". That's what I was asking about. How do you make it go back and forth and/or why isn't it doing so? Just let someone else respond to my problem.

From: MCH
Topic: 8124 Message: 8137

Yes, "again". I said twice that your scanner and the 396 should work the same way your older scanner does except that the 396 can 'chain' the search ranges.

I believe all of my answers have been complete based on the provided information. I DID make an error in saying 296 rather than 250. I'm sorry you could not read through that error.

My scanner starts at the low frequency, runs to the high frequency, and starts over. I don't know why yours is "sticking". Is it receiving a carrier? Did you enter frequencies outside a single band? (not sure if that would make it hang, but you didn't give any specifics)

The last I knew, you were having trouble limiting your search to just the one slot you programmed, as you said it was using slot 10, not slot 1. I told you exactly how to change that.

If it's a birdie, and you don't want to lock it out, you will continue to stop on it. That's the way scanners work. Not trying to be funny - quite the opposite. You didn't say how it is hanging, if there is a carrier, if there is any squelch noise or anything. I can most likely help you, but not when given a complaint of "scanner hangs". Does it continue with the search if you turn the scroll knob?

I am simply trying to help you find out why your particular scanner is not acting as it should, and as mine does.

So, at the risk of more flames, I will say that I tested mine and the search operates normally - it starts at the low frequency, runs to the high frequency, and starts over. It only 'hangs' when it hears a signal.

If you would tell me the frequencies you are using on your search, I will try to duplicate the exact environment. But please don't complain that an answer doesn't solve your problem when the description of the problem is incomplete.

Is it possible that it is stopping on a frequency that has carrier but
no audio? If you press L/O when it stops, does it start again?

Whoa. Joe is one of THE MOST helpful people here. And except for maybe Paul (UpMan) he is without question one of the most knowledgeable people there is when it comes to these scanners. In all of the years that I've been a part of these groups that he runs I've seen him walk some "people" through the simplest things, like how to turn the display light on, with far more patience than imaginable, and he's done it without giving anyone "attitude". Right now the only one giving attitude is you, and you need to check that at the door damn quick if you want people to help you.

>it just sticks on CUSTOM 10 even though I chose CUSTOM 1 as the
>place for my lower and upper frequencies. I can't get it to go to
>CUSTOM 1 even though I turn the knob to manipulate the up and down arrows.

The up and down ONLY changes the direction in which it goes through the frequencies, forwards or backwards. (low to high or high to low)

>I went to MENU, SEARCH FOR..., CUSTOM SEARCH. CUSTOM 1 appears and
>the low-high frequencies that I programmed take off with great speed
>from low to high

Hmm. Interesting, you originally said you couldn't get it to search "Custom 1" and now you can. So I guess Joe did help you solve your original problem. You did remember to say thank you right, after all, as you said we are all adults here, and as such by now we should know our basic manners and politeness.

So moving on to your NEW problem....

>and then it stops. I would expect my 396 to reverse itself
>automatically and either go back from high to low or restart at low
>and go back to high. But it doesn't. It just hangs.

Are you absolutely sure, 100% positive, that it's not picking anything up on that frequency? It is very possible that it's picking something up and you just can't hear it. My scanners and HAM radios do that all the time. It doesn't even need to be something on that frequency, just a strong enough transmitter in the area. I always know when one particular police vehicle is at the court house because when it is and I even get close to the place something about that particular vehicle's radios cause my scanner to lockup.

>if it stopped on a frequency I didn't care for, usually the ones
>that have sound effects from hell, I punched "RSM" or "L/O".

So you were willing to lock-out a frequency on your old scanner, but
you aren't willing to even do a temporary lock-out on your 396 to see
if that solve the problem????? Why?

>This is how my brain is programmed. I look for familiar functions
>and settings. I expect my 396 to be just like my 250.

The world has changed and continues to change. As such radio systems
have changed and continue to change. As such scanners have changed
and continue to change. Your new 396XT is NOT your old 250. It's not
going to be just like your old scanner, nor should it be.

> I'm not going to lockout a frequency when it's the fault of the
> 396. That would be stupid.

And how do you know it's the fault of the 396???

>I said the 396 started low and went high and it sticks on high. Read
>what I write. And I'll say it one more time, the 396 doesn't "start
>over". That's what I was asking about.

You need to go back and re-read Joe's response, and then actually
give it a try. Because without more specific information, that's
about the best answer anyone could possibly give you.

>Radio Shack flat out sold me a 396 and it clearly had been used and
>programmed although they sold it at full price. They fought me on the return.

Sometimes it only takes one sentence to tell us everything we need to
know about how receptacle someone is going to be to the help they
get, in your cast that was the sentence. Arguing with a store because
YOU didn't know that the scanner was pre-programmed at the factory.

Dean

OK..
First the person your mouthing off too is the list owner. Second he's forgotten more about scanners than you will ever know and third what's the big deal with getting 296 and 250 mixed up. Point is he DID answer your question and his answer is CORRECT! If the scanner is hanging its doing it for a reason. Hit lockout and. Once it gets past it (may take a few times hitting lo) it will finish searching and start over
Just chill and listen to MCH. It won't proceed because its hanging on a frequency.

I never created the CUSTOM 10 and I certainly did not punch in "959.9625MHz" So does this mean that a previous user of my fine 396 created this "CUSTOM 10"?? Was I sold a used 396? I just punched a number on the keyboard and the 396 went from "959.9625MHz" is to "946.1375MHz". So I someone has previously owned my "new" 396? I really don't know how to present this to Fry's to get a refund, LOL. It's way beyond their 30 day return policy. I'd be grateful if you could please tell me how I could access my CUSTOM 1 so I could at least listen to my frequencies as I ponder my alleged rip-off, LOL. Thanks.
>> >>>
>> >>> My BC250 had NO frequencies stored in the ONE thru TEN scan search channels so I can't quite get what you are saying. But once you program your low and high frequencies into CUSTOM 1 in your 396, how do you get back to CUSTOM 1 to listen to it? I tried

pressing 1 and nothing happened. My new 396 just seems to go to any CUSTOM range it wants.

8141. Understanding bc 396xt programming ?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-07-20 17:18:57 UTC
From: blastdad51
Topic: 8141 Message: 8141

Help !

I recently purchased the latest/greatest 396xt and the ARC-xt programming software. Now I throw everything I ever learned about the 296 and Trunking systems with banks/ groups etc out the window and start over. I understand the Dynamic Memory but I'm not getting the quickey deal and setting it up. If there is anyone out the who can help me get it clear I would greatly appreciate it

Thanks
Jim Adams aka blastdad

Maybe the simplest is to consider system quick keys as banks and group quick keys as sub-banks.

Sent from my Verizon Wireless 4G LTE DROID

For the System Quick Keys, think of them as a way to assign the 'bank button' to the Systems you have programmed.

Think of the Group Quick Keys as a way to select which channels in a System you want to monitor.

Does that help?

That's kind of how I've been envisioning it.I tried setting up my San Diego area trunking system and put all my NASCAR teams in a conventional system under different keys but when I loaded everything in it all ran together and I had a mess. So I guess I need more info on seperating my key and not listening to the conventional when I'm at home and teams only at the track ?

Were you using separate System Quick Keys or Group Quick Keys?

You can think of the difference as the same as the difference in folders on a computer - the System QKs are the folders and the Group QKs are the folders within each System folder.

Start with System Quick Keys when programming, then you can learn Group Quick Keys later. For System Quick Keys, start with the single-digit ones (0-9), load them on your scanner (erasing the scanner first), then try enabling and disabling each SQK using the buttons on your scanner (the same way you did on your 296).

You should see that each Quick Key controls a different System. This is easier seen by having only one SQK active at a time, although once you can visualize this you can activate any or all.

01 San Diego Main Key (Bank) up to 99 then under that you can set up Sub keys (sub banks)
01 Fire
02 EMS
03 PD up to 10
02 Nascar
01 Team 1
02 Team 2 again up to 10
When scanning by pressing 1 or 2 Key you turn them on or off
Also all my system I set up I put the (Bank) # in front of it so it will be easier to remember what System goes with what #

I'm sure you'll get a lot of responses --- I went through the same thing and it was painful, but I can assure you it's worth the effort in the end.

To keep it simple --- get a copy of FreeScan to use programming the radio. It makes things a bit easier.

Rather than worrying about any particular channel, you need to think in terms of building systems with groups and activities within those systems.

For example:

System: NH Towns - Quck Key 1

Groups: Nashua

Activities Police

Fire

EMT

Hollis

Police

Fire

Etc..

System: Local Air --- Quick key 2

Groups: Manchester

Tower

Ground

Quick keys 1 and 2 above would show on the scanner the way channels showed on other scanners.

There are many variations on the above depending on how you use the scanner. Decide for yourself what works best.

Good luck..

ARC-XT has a 30 day trial version. Try it and decide for yourself.
Many FreeSCAN users seem to forget that a donation is appropriate when the user continues to use it.

One of things I like (among others) with ARC-XT is that each system is a separate file.

I'm in Lakeside. I listen mostly to Santee Sheriff and Heartland Fire. I also have some Edcas Systems I listen to when I'm out of town and NASCAR teams when I'm at the track. I'm not getting the Qkeys thing when I set up a system or site. When I send it to my scanner it all runs together and it turns out all wrong. I can't turn off the EDACS system or the NASCAR ugh !!

Michael,

Your response was most helpful in understanding concepts. Do you use a software program to help with programming? If so which one?

I use FreeScan and find it very easy to use and very intuitive….

Good luck

Michael,

Your response was most helpful in understanding concepts. Do you use a software program to help with programming? If so which one?

Lakeside, good. I'm in Chula Vista. Perhaps we can meet some evening this
week and I can help you out. I only have a BCD396T so I am not up to speed
on some of the capabilities of the BCD396XT, but the concepts are the same.
Let me know.

8157. P25 Issue

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-07-29 12:42:45 UTC
From: Jeffry Rehm
Topic: 8157 Message: 8157

I have an odd issue with my xt that I think should be shared. In the past two weeks or so I have had two P25 trunking systems, or part of the systems, stop working. This will be tricky to explain.

One of the systems is a 700/800 system that would appear to scan correctly (signal bar showing five bars for the control channel) but would not decode the system ID or site number. There has been no changes to any of the frequencies for the system. After many attempts to check settings I deleted then reprogrammed the system and immediately began hearing the system normally again. Everything works fine.

The other system is a multisite 98% VHF hi band system. Right now no 700/800 MHz freqs/sites are being used on the system so I don't have them programmed in yet. This system also just seemed to stop working. However in this one it was decoding the system ID and site number but would not show or stop on any talkgroups. So the end result with this system was the same. Not stopping on any voice channels. BUT in this case I did not reprogram the whole system. I deleted and reprogrammed the "site" that I knew was causing the perceived problem. It too began working perfectly.

I program 100% by hand from the keypad. I do not have the latest firmware because I do not use computer for programming and online connections. And the last time I sent my unit in for repair at Uniden they did not update my firmware as I asked (though they have in the past) but don't get me started there, sorry.

Does anyone have an idea what is going on with this issue I am having? Is this happening to anyone else out there? Hope this isn't the beginning of continued problems for me in the future.

Thank you.

8158. Brain Hurting.. Have 396XT. Need Help with Software

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-07-31 22:12:23 UTC
From: kbarnsda
Topic: 8158 Message: 8158

Hello,
I have gone through this site and gleaned all I can hold.
I am going from a Home Patrol and many many other scanners and having problems with new way of doing things.
I have watched all the videos from Opitz I can find and think I have a very basic understanding of what I need to do... forget all I know.

I also printed out the manual from markscanners dot com a and have read it through.

My usb cable arrives today and I don't know if I can read another manual without total meltdown.

I only want to learn one more thing. Price does not matter at this point. I gave a "dry run" with the FreeScan program and it hooked up perfectly with the RadioScanner database chaps and I was able to get it to look like it would work.

My problem... The cable arrives later today and I don't want to commit to the FreeScan if there is a better program out there.
I live in a remote area with only one tower available and a Motorola APCO-25 system. I have all my id ready to plug in.. plus lots of analog frequencies to sort through and put in groups.

Any suggestion if this is the best program for me?
I really don't mind the RTFM thing but I just am giving out.
Appreciate the help.
Cheers.. fried old newbie.

You don't have to commit to Freescan - It's free. No biggie.

Freescan works beautifully for programming the 396XT. When you get your cable, load the drivers for Windows, reboot, then you should be
fine to run Freescan, and connect to your radio.

Only you can answer that. Try them and see
which one you are most comfortable with.

Thank you! This was pretty much a no brainer.
I did as you said and it scanned immediately. I guess I want to donate something to the chap.
I still am perplexed as to why it was so hard to program by hand.

I am reasonably stubborn so I will first learn how to use Freescan totally.. then
go back and try and figure out how to do it by hand.
Thanks for reply.
Any tips for increasing my learning curve for Freescan?

Ken

Just DL from RR and compare the setup to the web listings.

When starting by hand, start simple - with a conventional System. Make a
Group, Make some channels. Set the options.

Then do the same with a trunked system once you have Conventional down.

Hi,

I would like to buy a 396XT but it has been on the market for awhile and IM afraid I will buy it and a new radio will be released buy Uniden soon.

Does the Group know of any plans to discontinue the 396XT and bring a new model to market?

==========
I understand they released a new firmware update for the 396XT a few months ago.

If I buy a unit now, will it have that update in it?

Best Regards
Sincerely,
Ted

plenty can still go wrong, I have to use a USB cable not the serial port cable since my pc is fairly new and no longer comes with an RS-232 port. I downloaded the updated driver and my pc recoginized the cable but it doesn't see the scanner. The software says if your pc doesn't see talk to vendor tech support. I guess before I bother tech support I will try to reboot pc just in case, but I figured if the pc sees the cable I shouldn't have to reboot.

Hello,
Once again, thank you for your suggestion. I will do it exactly.
It is a shame that Uniden does not ship with a USB cable, 1 month trial to RR, and Freescan.
Freescan should charge. I do appreciate that they did not so I will certainly stick with them rather than the .nl chaps that I have dealt with for years.

I think it would result in a lot more radios not being returned.
My radio this morning has gone from a $400+ brick to a

radio that will not shut up. I need to get out paper and pencil
and get it organized so I can turn on/off systems easily.
Right now I am getting overloaded with traffic which is

unheard of where I live. Smallest state.smallest county.smallestcity in USA.
Thanks again for help. Perhaps these comments will be of use to others.
Cheers,
KenB

Ted,
That is the exact reason I bought the 396XT. I am tired of being on the bleeding edge of new products. It seemed that there were enough people out there with the 396XT that I should have programs and help if I needed it.. which I did.

The suggestion of the "FreeScan" program by this forum was really helpful.
This is essentially my first day programming it and I have it more operationally useful than my HomePatrol which can be programmed in less than 5 seconds. I also liked the size.

My only problem was paying $450ish from Amazon as I am sure it will fall down to $350 once another model comes out. This may be my favorite scanner of all time and I have only had a day to dink with it. It has a good feel and seems bug free.

I have an old laptop running Windows7 and the $35 cable from Uniden worked like a snap. I chose to go that route as there were complaints about trying to cobble one together with the enclosed serial cable...

IMHO!

Cheers!

Subject: [BCD396XT] Re: Brain Hurting.. Have 396XT. Need Help with Software

Hi,

I would like to buy a 396XT but it has been on the market for awhile and IM afraid I will buy it and a new radio will be released buy Uniden soon.

Does the Group know of any plans to discontinue the 396XT and bring a new model to market?

==========
I understand they released a new firmware update for the 396XT a few months ago.

If I buy a unit now, will it have that update in it?

Best Regards
Sincerely,
Ted

If you're using a USB - serial adapter (at least on Vista or newer)
which uses a counterfeit Prolific chip (turns out I have 2 of these!),
you need to install an older Prolific driver on your system, or the
cable won't work. This is a common 'gotcha'. The symptoms are:

1. No communications is possible.
2. In Device Manager, the serial device provided by the cable has a
yellow exclamation mark next to it and the text "This device is not
working properly" appears.

In this instance, you need to locate an older version Prolific driver
for your system. They can be downloaded off the net.

Freescan certainly works well. I use it for programming my scanner. I haven't downloaded off RR yet, but as the fire service here is on the cusp of going P25 (and trunked dispatch by the looks of it), I will be looking at my programming options - probably Freescan with manual input, given I'll want to get it up and running ASAP. Depends which route gives me the frequency and talk group information I need first. :) This will be the first trunked system I've programmed in any scanner or computer. :)

If you are using arc xt pro software the manual tells you that and points you to the link to download the driver. My computer is windows 8 and while it sees and id's the cable it doesn't see the scanner.

I have programmed a Motorola system TypeII/P25 correctly using tower A. There are several talk groups assigned to this tower. It is working perfectly.

I am getting ready to travel 100 miles to another area... same System.

Since this is a sparcely settled state, this same System is used statewide. The unit's move freely about a 100 mile area. There are 3 towers (groups) spaced over this area. My area for simplicity is "Tower A" programmed as its own group.

I now have one tower (group) programmed correctly and working.(A0
I then enter the other 2 rempte locations as correctly programmed groups, with no UID's assigned to them..... Area B and area C.

My question is this.
When I get into their area (B&C), will the UID's I already have assigned, on another tower(A) (Group) BECOME operational for these new towers(groups)?

ie Will they transfer from my area (A) to these areas 75 miles away?

On the 396xt, I would them just enter 2 empty groups, with the correct tower frequencies entered and just let them "sit empty" till I got into the areas and then the UID's which move freely would then automatically work???
Thanks for help.

I'll try to answer this. But first, I'm going to assum that by "UID", you actually mean "TGID." UID identifies a specific radio on a system, while TGID identifies a talk group (shared by many UIDs. Typically, when scanning, you program TGIDs to listen to.

If there is a user on the TGID you are interested in hearing affiliated with a tower you are monitoring, then the traffic for that TGID will be carried on that tower. If no user affiliated on that tower is set to the TGID you are interested in, then the traffic for that TGID will not be carried on that tower (since, as far as the tower knows, there is no one within the tower's operational range to receive the comms).

In the scanner, Sites and Channel Groups are independent. Any enabled channel groups are going to be attempted to be received on any enabled (and received) site.

You may want try and program "Tower A" as a site. Then you can add "Tower B and C" as a second and third site. The scanner will simply go through them and you will never know the difference. Also set the HOLD TIME to 0 on each site. I am sure my answer is nowhere close to UPman's but it could help. Maybe.

I found your post a little confusing but...

You can program all three towers as one system. Just enter each tower as a different site. (you should be able to add the other two towers as additional sites to your existing system). You can even assign each site it's only quick key. Then whatever talkgroups you have programmed for the system will work with any site.

I have a very large system programmed like this and it works great. It's one of those features that I hope Uniden never removes.

Dean, VA3DBD

Hello,
You made me laugh. I also found my post confusing.

Thank everyone for your answers.

I understood them all but Dean's answer helped me with what I was doing. It just seemed too simple. UpMan thanks for taking the time. I have watched most of your videos and I know you are busy.

YES ... I will assign quick keys to the towers I do not want and enable/disable as needed.

Also please excuse mylack of proper terminology. I am in day 4 of trunking and having quite a splashing party. I have gone for absolute hatred of the 396XT to absolutely loving it.

I think I am going to have to travel with a laptop to enable loading different setups on the fly. I already have 10 subdir with different setups for traveling.

Thanks again for the answers. I will actually use them tomorrow.

With the size of the memory in the 396XT why not just load bunches of stuff into the scanner. Assign Quick Keys to all of them and just Unlock/Lockout the systems as you desire?

There are 100 quick keys available, and you can assign more than one system the same quick key thereby turning on/off multiple systems at the same time. Or they could all get theri own quick key.

Hello,
EXCELLENT question. Here is my reason and it may be unfounded. I have only had the radio 1 week and I am learning how to use.
I need to test. Here are my reasons at this time.
1) I am not sure of the processing power of the scanner and if it is impacted by having a system fully loaded.

2) It is extremely convenient using keys 0-9. It only involves one push and is confirmed by a STAR showing up in the place of the number. Once you go over 9, it is not as easy to see what is or is not locked out. The main reason would be be convenience and confirmation of on or off on the screen.

3)I am very anal as far as programming things. I change and then change again and again. It is easier to have certain "loads" that I only use for certain times and them not clutter up the system. I find that I sometimes make errors and then I don't have all my eggs (setups) loaded in one basket so to speak.

The way I am going to test is to load the original programming and then delete my state and then put in my frequencies and see how things work. This should be fairly easy as the Uniden thoghtfully put their loads in positions starting at 21-46.

And remember... I am totally new to this and spoiled by the Home Patrol that I used up to now. I went from baby formula to 3 course steak dinner.

Cheers..

1) Trunked system "scanning" speed is not impacted by number of channels (or other systems) loaded into the scanner. Actually, if channels are loaded into systems/sites/channel groups that are not enabled or that are locked out, they don't have any performance impact at all. Otherwise, they only have the normal impact you would expect (if you have a lot of stuff turned on for scanning, total scanning cycle time will be increased).

3) The preloaded systems are now years out of date. Most will not properly scan, as the systems programmed have had significant changes since 2008 or 2009, when the preloads were created. Don't let their presence deter you from erasing them and using their SQKs for your own purposes.

I see where you are coming from.

I don't see having the memory fuller will effect scanning speed, only depends on which are actually being scanned or not.

I know what you mean about easier to see 0-9. You have to look for a fairly small number at the beginning of the line to tell the difference between 03, 13, 23 etc.

Mine is 99.9% full, and I am usually only scanning a SQK or two, and it flies as fast as if those were the only Systems in the scanner.

David,
You are absolutely correct.
I will take your suggestion. Thank you.

I originally thought the full "load" would impact performance but UPman and others said no.. I also had issue with being able to see the groups easily.. but there is an extremely simple way that just came to me and is probably what you were talking about.

If I mentally use groups of 10... I can effectively have 10 separate, easily monitored "scanners".
Since the scanner tells you via the first 2 characters S2 or S3 etc you know always what bank of 10 you are on. You can also easily see, via the * which ones you have turned on and off.

Therefore, in my own town, I have AIR channels assigned to #1 and Rail assigned to #3 and Highway Patrol on #5 etc. I have gotten very used to this.

Using this same logic, I don't have to relearn or carry a crib card.
All I have to do is remember which bank goes to the city I am traveling to.

Example.. Denver.. I assign group 60-69 via Quick Keys.
#61 would be (DIA) Denver Air.. Highway Patrol would be #65 Etc. etc.
It would seem just like my home area and all I would need to remember is which BANK goes to which city.

All I do now is turn ON or OFF the BANK, via quick keys, that correspond to the city or area that I am in.

The one extra keystroke is more than offset by convenience of not loading and unloading via the computer.

SO... THANK you for the suggestion. You were absolutely correct!!!
Cheers

Again, the uniden Dynamic Memory scanners do not have banks.
Instead of using up all the SQKs, why not not also assogm GQKs (Group Quick Keys) within the system.
In your example of Denver.
SQK60= Denver
GQK1=Denver Air
GQK5= Highway Patrol
ETC.

On all my System I put the corresponding # in front of the Name so it will be easier to remember/memorize it.
In your example of Denver.
SQK60= 60 Denver
GQK1=01Denver Air
GQK5= 05Highway Patrol

Hello,
I took a day to think about what you said.

Had You not began your reply with "Again" I would not have replied as it would have been just your opinion, which you are entitled to. I wondered if I had made myself clear in what I had posted.

I say this respectfully...

The easiest way to explain where I come from, referring to "Banks" which of course there are not, is to refer to the Windows operating system. You have the option to use the new release Windows setup or, revert back to the old version menu structure that you were more familiar with.

In this case.. Since I cannot revert back to "Banks" that I am most familiar with, I have a way that I can have pseudo banks and feel very at home. I agree that the newer and better Dynamic Memory System is the way to go. As I read others posts how they are using the system as you described, I may very will go that route.

For now, I choose to go this way. My reason for posting was in case there was one other person having a problem with the new way of scanning.

Thank you for your suggestion and I will try and wrap my head around it. I guess I am a perfect example of teaching an old dog new tricks.

Cheers!

I purchases my 396xt the last week of 2012. This is not my first scanner. I own Icoms, Uniden trunk trackers, but this is my first digital capable scanner. My commute is 60 miles one way through two different counties. I got stuff from 40.00 to 800.00 MHz. Digital and analog. It has taken me about seven months using Freescann to figure this thing out to about 95 percent it features. (I think) I was learning some thing new every weekend. So to all of you newbies don't give up. This is an awesome radio.

Hello,
I have checked the last 2 years old posts trying to find an answer and have been unable to. It must be really simple... but has me stumped.

I am trying to find out how to enable the "Max Hold Mode".
I am currently in the Search mode and want to switch.
I have the SRCH MF showing in the top of the screen.

I understand from the menu you can change to CF, SPN, and STP by cycling the .no button.

I cannot seem to find how how to get to the Max Hold Mode.
It must be in another menu and I cannot seem to locate it.

Thanks for help....
Also... other than the obvious, does anyone have any special tips how to use this mode. By that I mean tips/tricks for using it.

I am experimenting using a GMRS handheld trying to see how it works before I go searching.

Cheers..

I just bought a new computer and do not have a serial port. I looked through the archives for a good USB-to-scanner cable and received 6 messages. They all had to do with the Uniden USB-1 cable. I am hesitant to buy that cable because of the high price ($30) and it may not work with Win8. I do not know if they got the new batch of units in.

Does anyone know of another place to get a useable unit? I am hesitant to go to Amazon because of the same issue, it may not work. Has anyone got a working unit recently and has a URL to the unit?

Thank you.

Mike

I know how you feel.
I just bought 2 from Amazon with free shipping.
Both worked fine on my 396T & 996T.
Installation was easy on My Vista box & Win7 laptop.
Used the CD that came with them for Vista & just plugged one into
the Win 7 and it went to the manufacturer's site & got the latest driver.

"Thanks for choosing the Plugable PL2303-DB9 serial adapter!
For up to date driver and product information, visit http://plugable.com/drivers/prolific"

I purchased a "TRENDnet USB to RS-232 Serial Converter TU-S9 (White)" from Amazon and it worked fine with my new BCD396XT. I have Windows 7 Pro 64-bit. CAREFULLY follow the included installation instructions. Basically you have to install drivers for the adapter, and then connect the scanner.

The original poster was more concerned about the USB-1 cable working with
Windows 8, rather than Windows 7.

Clark,

Thanks for your message and URL. That is what I am looking for. However, at $5,000 that is a bit much to pay! LOL they must be having a problem with the site because when I put it in my cart it says $5,000. Now I need it and I like it BUT not that much! LOL I'll investigate or send them a message or something. Something has got to be wrong.

Do you have any more URLs?

Again, thanks.

Hi fellows and gals, I just bought a 396XT. I have a question regarding the display. In the past I've had scanners and ham radio hand held equipment that had peel off plastic sheets to protect the display in transit.
This radio seem to have a not so durable covering over the display. Is this part of the display or does it peel off?

As I recall, that protective film isn't easy to get a hold of to peel it off. Start very carefully at one corner with a fingernail or maybe a toothpick, but be careful not to scratch the actual display face.

A new unit has a plastic covering on the display.
Mine was off day one and my scanners take a beating but no issues with the displays on them (396T and XT) . I'd say Uniden uses pretty good screens to survive what I throw at them.

Topic: 8224 Message: 8224

... i've been a gadget guy for decades now. i'm the one people call on to program their casio watches that have 955 functions and two buttons and they've lost the manual. i built (helped build anyway) the first pc from a kit (altair 8800). i used to hack dos. i laugh while re-compiling my linux kernel. i have, if not mastered, am able to operate most everything imaginable as far as firmware and software and user interface goes.

but with the bearcat scanners i admit defeat. i currently own at least a dozen, maybe more, radios and none put the fear into me like having to use the keyboard on the 396xt. well, maybe the yaesu vx7 a little bit--the 'quick' guide for it is about 75 pages long!

i've never been able to use the 396xt for more than the time between reading the instructions and my memory of reading them and what keys to press collapses. let me say i have no problems whatsoever programming the 396xt with any of the software out there. i have about 60 systems programmed, but when it comes to touching the keyboard, i'm ashamed to admit i own a $600 scanner and i'm reduced to pressing '1' and '2' to toggle between my home and work systems and i'm terrified of hitting the /function/ key accidentally at night and attempting anything else due to invariably getting it locked in a mode i can't for the life of me recover from.

i mean, the very paradigm of the scan mode being on all the time instead of waiting for me to press a /scan/ button gets me off on the wrong foot to begin with.

anyway, today i wanted to test my wouxun uv6x on our work channel of 467.925 since i was able to receive but my transmissions were not coming through. i simply wanted to determine if i was transmitting because we use tsq (tone on both send and receive) and that was the likely culprit and all the radios here at work are locked and in tsq mode, so i can't use one of them to test w/o tone.

so i hit the /hold/ button on the 396xt and type in my frequency: 467.925. the 396 does say /direct entry/ which is the most helpful it ever gets and i am grateful. but then i hit the 'E(yes)' key to finish the input of the frequency. the 396xt, instead of taking my input and displaying the frequency very unhelpfully prompts: 'quick freq save?'.

well, no. if i wanted to save the frequency i'd want a /save/ key so i could have control over it. just enter the frequency i typed in and if i want to save it somewhere i'll figure that out later. i have no idea where it wants to save this frequency or whether having it saved will come back and bite me in the ass later--that sort of thing happens constantly. so i'm lost. i can either hit 'E(yes)' and let it take me into an uncharted menu tree from which i can't get out of, or i can hit '.(no)' to cancel.

but i lie, hitting 'no' doesn't cancel anything. it takes me into a different menu tree that i never asked for, don't want, and don't know how to back out of. i have to resort to hitting the /.no/ key again to (hopefully) get out of this menu without changing anything.

and now i'm back at /direct entry/ and my frequency is there, but it's not yet 'live' as there's still a cursor block on top of it.

i haven't yet figured it out. i had to resort to the close call feature (and don't get me started on that prompt for 'hit any key ...').

[later note: it appears hitting /hold/ button again after entering the frequency might do it. but the radio unhelpfully displays /quick search/. i don't want a quick search, i want it to stay on the frequency i typed in.]

luckily the close call feature alone is worth the price of the radio. i used to have 3 bulky boxes costing about $1500 in total just to clumsily try to have that feature.

i hate to say it paul, but for me i just can't see how the 396xt user interface could be any less intuitive. perhaps being a lifelong radioman and computer technician has instilled me certain ideas about how such things should interact with the user and i'm just incapable of learning a new paradigm despite owning every single scrap of documentation available on how to interact with this box. the best thing i can say about the user interface is that i'm sure the radio shack scanners were worse.

I understand your frustration, however, mine happens to be the other way around. I have not used nor even tried to use any software program to operate my 396xt. I have done everything from the keypad and can, for the most part, figure out what I need to operate the scanner as needed. Don't get me wrong. I have had MANY headaches and at times wanted to throw the scanner as far as possible away from my hands. It took me a full six months of learning one or two things a week or every couple of days. I still do not know everything about the scanner and will not use every feature but I am glad all the options are there. There are hundreds if not thousands of listeners out there that do use the other features.

That is part of my dilemma also. I did download one free software program to see what it looked like and to see if I could figure out how to use it. Turns out I stared at the screen for a couple of days and said the heck with it. Since it came with no instructions it was assumed I already "knew" what to do with the software. Like I made myself, right? And all the problems in the beginning with cable issues, adapter issues, baud rate issues, zip file issues, well, you get the idea. I just did not want more frustration. So my dilemma is I am afraid that any new version of a scanner "may" be PC programmable only. Pros and cons, I know. But you need the flexibility to program and fix things on the fly. No way you can do that with PC programming only. But it is also nice to be able to program hundreds if not thousands of frequencies on your laptop instead of the keypad. Again, it is great to have the features. Even though I myself may not use them.

Congratulations to Paul and most everyone at Uniden for coming up with the worlds greatest scanners these last few years. Hopefully they will keep "everyone" in mind whenever a new version, or versions, of scanner come out for us all to, ahem, enjoy.

Have a great weekend.

well, no. if i wanted to save the frequency i'd want a /save/ key so i could have control over it. just enter the frequency i typed in and if i want to save it somewhere i'll figure that out later. i have no idea where it wants to save this frequency or whether having it saved will come back and bite me in the ass later--that sort of thing happens constantly. so i'm lost. i can either hit 'E(yes)' and let it take me into an uncharted menu tree from which i can't get out of, or i can hit '.(no)' to cancel.

but i lie, hitting 'no' doesn't cancel anything. it takes me into a different menu tree that i never asked for, don't want, and don't know how to back out of. i have to resort to hitting the /.no/ key again to (hopefully) get out of this menu without changing anything.

and now i'm back at /direct entry/ and my frequency is there, but it's not yet 'live' as there's still a cursor block on top of it.

i haven't yet figured it out. i had to resort to the close call feature (and don't get me started on that prompt for 'hit any key ...').

[later note: it appears hitting /hold/ button again after entering the frequency might do it. but the radio unhelpfully displays /quick search/. i don't want a quick search, i want it to stay on the frequency i typed in.]

luckily the close call feature alone is worth the price of the radio. i used to have 3 bulky boxes costing about $1500 in total just to clumsily try to have that feature.

i hate to say it paul, but for me i just can't see how the 396xt user interface could be any less intuitive. perhaps being a lifelong radioman and computer technician has instilled me certain ideas about how such things should interact with the user and i'm just incapable of learning a new paradigm despite owning every single scrap of documentation available on how to interact with this box. the best thing i can say about the user interface is that i'm sure the radio shack scanners were worse.

I guess I'd have to agree with gteague on this one. I got started in electronics back in the mid sixties, serviced every type of electronic gear imaginable, been a ham radio operator since 1968, started in computers with a 8088, spent over 16 years in the wireless industry through four major technology changes, and I have yet to run across a more unintuitive user interface than that on the BCD396XT scanner. Yes, it's a great scanner, and as the writer below states, it is fairly easy to program with computer software. But, don't use it for a few weeks and then be out and about with the scanner and need to do something without a PC nearby and panic takes over. I've accidentally locked out stuff I never knew was locked out until seeing it on a download, and I've activated scans and searches that there was no apparent way to stop with the on-device keyboard. One has to wonder where the quality control and user testing was during the design phase of this scanner. I shudder to think how bad the UI will be on the new Uniden that's in the works.

Don't get me wrong. Not bashing Uniden here, just some constructive criticism and end-user input that I've experienced and heard from others as well. A large segment of the general public who have trouble figuring out their TV remote will never buy this scanner for this very reason.

You had it correct by pressing "Hold" again. The display will be "Quick Search" and the freq. , it is now parked in the displayed freq. and not searching. Pressing "Scan" will exit the direct freq. mode.

now see--a prime example of what i'm saying.

be honest, if you didn't already have that memorized, how likely would you be to guess it?

i suspect that most could guess you need to hit /hold/ to stop scanning, but to hit /hold/ again to /enter/ the data input? who could guess that? ever?

since the dawn of the digital age it's been 1) input/display the data, 2) enter it into a working register. and what makes it worst is that the scanner actually has an /enter/ key.

i suspect that if you gave your scanner to 100 semi-electronically-literate people approximately 75 (or more) of them would hit the /enter/ key. 23 of them would have given up because they didn't know you had to /hold/ the scan, and the last two would simply have dropped your scanner in a mud puddle and walked off fuming. [g]

and also /scan/ won't get you back to scanning in all cases. as mike pointed out, you can easily get lost in some menu structure and there's no /escape/ key that works consistently, imo most likely the single feature most needed.

The biggest problem programming scanners is overthinking things and making it harder than it really is. I see it all the time and can't count the times I have talked people through the process over the phone. Every single one later said "that was actually easy" and it really is if you don't make harder than it is by over thinking things.

gotta disagree with you on the over thinking aspect my friend.

anyone who has worked with digital hardware and software knows that you input the data, then you operate on the data. that means you look for a command or a button with an active verb such as /enter/ or /input/ or /store/ or even just /go/.

/hold/ i guess is an active verb and i guess you could say that you want to /hold/ this frequency on or in the display. but normally a command such as hold would require you to tell the system where to hold it--it seems to need an additional parameter. but also you're already using /hold/ to control the scanning and to imagine it as being an input key as well requires the over thinking, imo. i guess what i'm trying to say is that yes, it is easy. easy as pie. exceptionally easy. file it away in your memory and you're done. and then file away 124 more such 'tricks' and you're good to go.

but my point is that if you don't have a good memory or have your book or notes with you, it is most definitely not intuitive to figure out in the field.

i just don't have enough memory stack left to deal with it. i depend on my logical facilities to bail me out of this ongoing memory loss. but the normal logic i've depended on my whole life fails completely on a very good percentage of this system.

I have used or owned about every programmable scanner made. Much of the programming is common sense and some learning of tricks etc. I myself rarely even look at a manual for a new scanner as basic programming doesn't really change all that much. Banks or DMA doesn't really matter on memory type. For other functions I can usually figure them out just by the menu and the keys and their use. Sometimes I forget which scanner I'm using and a function and a key press might do different things from one model to another like the 396T and XT (I have both and use them 24/7). It really IS easy but you need to play and learn. I usually tell people who buy a new scanner to read the manual three or four times and start off programming a few conventional channels then a trunked system. You really don't have to remember everything as 99% of what you need to do us through menus or the function button and the keypad or just the keypad. So yes it is easy......

So far it sounds like I am in the minority. I do know a few people that have the 396xt that program it by hand, like myself, with the keypad alone so it can be done. It really is not that hard. At best those that rely solely on a PC for programming should know how the keypad works in case of computer crash, power outage etc. It is just a suggestion and opinion. Thanks for a great group of guys. (and gals)

I have to agree but I have no where the same amount of experience as you. I got the scanner into scanning Public Safety and could not get it out. I tried everything even taking remote control of the scanner through FreeScan. I was getting very frustrated. So I got online to the easy to read manual. It showed me how to start various tasks but I quickly noticed that it doesn't always show how to stop the task. Maybe it was there but I sure did not see it. Of course I was under pressure because the scanner found a channel and was motor-boating itself to death and would not move on. I did a temp lockout but it kept finding another channel to make noise on. I don't know for sure what I did but I find got it to stop scanning the Public Safety freqs.

Don't get me wrong. I love the scanner. But it sure can be confusing and frustrating at times. I agree with you that most of what I do is programming through FreeScan. Doing anything on the keyboard scares me to death! LOL I'll keep trying so I learn it someday!

Mike

well, no. if i wanted to save the frequency i'd want a /save/ key so i could have control over it. just enter the frequency i typed in and if i want to save it somewhere i'll figure that out later. i have no idea where it wants to save this frequency or whether having it saved will come back and bite me in the ass later--that sort of thing happens constantly. so i'm lost. i can either hit 'E(yes)' and let it take me into an uncharted menu tree from which i can't get out of, or i can hit '.(no)' to cancel.

but i lie, hitting 'no' doesn't cancel anything. it takes me into a different menu tree that i never asked for, don't want, and don't know how to back out of. i have to resort to hitting the /.no/ key again to (hopefully) get out of this menu without changing anything.

i hate to say it paul, but for me i just can't see how the 396xt user interface could be any less intuitive. perhaps being a lifelong radioman and computer technician has instilled me certain ideas about how such things should interact with the user and i'm just incapable of learning a new paradigm despite owning every single scrap of documentation available on how to interact with this box. the best thing i can say about the user interface is that i'm sure the radio shack scanners were worse.

I like to think they realized this and their solution was not to scrap the 396 but to release the HomePatrol.

IMHO... My 3 cents. The scanner is brutal. I could have never made it without Paul and Free Scan.

The only thing I can compare it to is in another life.... breaking apart my first SNA data stream. How could 2 small lines of code have so much information contained in them?
However, a programmer from Sweden, making 4 times my salary, could
find errors as fast as his finger would slide over the printout. After I bled for 6 hours, I could request him to help me.. and 5 minutes later.. I had the answer. I did drink a lot back then.

So what... The scanner is absurdly easy... once you get how it works straight in your head.
It does suffer greatly, in my opinion, from lack of a sensitive technical writer.
What it lacks is one thing... it is not intuitive. It is a brick when you first open the package.
For me.. it was still a brick 3 days later.

Even windows, in their arrogance, allows you to drop back to a familiar menu system when they
introduce a new version.

I was brought into IBM corporate, in Atlanta, to teach the executives DOS. I still remember the
comments of one of the chaps... " you mean people are really buying this crap". It was really funny to me.
How could sub-directories be so hard to understand? It threw many of these 6 figure income people
so it was not a case of lack of smarts. It just broke their paradigm. They were also angry at having
to "learn" about the product that was destined to make history.

OK... so what could Uniden have done? Many things... but no need to mention the obvious.
SO.. what could Uniden do now?

How about a decent technical manual... hell, even charge for it. I would have bought it.
I paid an extra $100 for the Home Patrol after I forked out a fortune for it.
I never complained although many did. It was a great feature set. You want it.. fork out the $$.

A video course, with examples, with decent sound and clear video would sell.
Take a simple system... start from scratch... Keep the new terms consistent across the videos.

IBM used to make a lot of money teaching its sales force to consistently answer a simple question... "so what"... as they explained the merits of their systems. Use this same approach
when explaining the scanner. There are pages of features but virtually no "so what's".

I have started several times, just for the fun of it, to put together a good study guide with videos.
The 396 is at the end of its life cycle so why bother...

I wonder if the new one is going to be a mixture of the Home Patrol combined with the flexibility
of the396.   I totally love the features of the 396 so I just sold my Home Patrol last week while I could
still get some money for it. Even it could be improved upon.

It does hurt to fork out $400 or so bucks and not get a good "first experience".
SO many ways that could be remedied.
Work a deal with a free 30 days with RR.   A little script and you are up and running.

I don't feel I can complain as I learned to work with debug and edlin just fine.
I also liked word star... it worked. I resisted Windows. I liked setting jumpers and addresses...and it made me scads of easy money. Those guys are
out of business now. SO... why should Uniden change. They have little competition.

I feel really sorry for the Mr. Opitz (spelling?) chap. He must enjoy his work.
I would not have the patience he has...
My mantra would be bleed and read. Everyone else has.
Oh well...   thanks to the people who answered my stupid questions.
And yes.. I am still bleeding with the 396.

To quickly monitor a frequency, hit HOLD (FREQ) HOLD
and you will be "in VFO mode" to use a common ham term.

You could read it in the manual.

You could also read the "escape" key is the lockout button.
(at least in any menu items)

Really, the only thing different about DMA is that you have to remember
before you program a channel you have to create a System for it, a Group
for it, and create the Channel. Everything else is much easier than the
old "function key combination" since the DMA scanners are menu driven.

Joe M.

John Stark wrote:
> I have used or owned about every programmable scanner made. Much of the programming is common sense and some learning of tricks etc. I myself rarely even look at a manual for a new scanner as basic programming doesn't really change all that much. Banks or DMA doesn't really matter on memory type. For other functions I can usually figure them out just by the menu and the keys and their use. Sometimes I forget which scanner I'm using and a function and a key press might do different things from one model to another like the 396T and XT (I have both and use them 24/7). It really IS easy but you need to play and learn. I usually tell people who buy a new scanner to read the manual three or four times and start off programming a few conventional channels then a trunked system. You really don't have to remember everything as 99% of what you need to do us through menus or the function button and the keypad or just the keypad. So yes it is easy.....

Hand programming is tedious, but very possible.

I prefer SW (my 396 has almost 25000 channels), but I completely
agree about knowing how to operate and program the scanner manually.

Joe M.

Jeffry Rehm wrote:
> So far it sounds like I am in the minority. I do know a few people that have the 396xt that program it by hand, like myself, with the keypad alone so it can be done. It really is not that hard. At best those that rely solely on a PC for programming should know how the keypad works in case of computer crash, power outage etc. It is just a suggestion and opinion. Thanks for a great group of guys. (and gals)

i'm sorry. there is a perfectly good /enter/ key already. the /hold/ key might as well be random characters.

also, there is a /N/ key which sometimes does an escape function. why use the totally non-intuitive /lockout/ key instead?

the attitude is 'why don't you just understand this?' or 'why can't you remember this'? yes, you too will one day age and lose memory function as i have. severely.

actually, for many functions it would be _better_ to just assign a random key with no label on it rather than have people like me who have forgotten one of the 195 keystrings they have to memorize try to intuit what key you should hit.

what i'm saying is that /hold/ makes no sense and /lockout/ makes no sense in the contexts you are describing. it is evident that the programmer/architect who understood every aspect and byte that went into the code mapped the functions to the keys. it is also evident that this programmer had never met an end user.

well, the bottom line here is that, for a short period of time, i needed my radio to perform the single basic function that even the most basic radio is designed to do--receive a single frequency. and i was unable to set it to do that single basic function despite 50 years of radio experience, 30 years of computer experience, and a half dozen years with this and the previous model simply because i'd forgotten one keystroke command.

there is no doubt that is a FAIL, but whether you put the blame for that on me or on the radio designer is up to you, but i'm able to figure out how to do this supposedly simple task on nearly every other radio i've ever had my hands on and it was extremely frustrating to not to be able to do it on the 396xt because some programmer decided that the /hold/ key was just as good as an /enter/ key.

I am reading this with GREAT interest, and this jumped out at me:

>> anyone who has worked with digital hardware and software knows that you input >> the data, then you operate on the data. that means you look for a command or a >> button with an active verb such as /enter/ or /input/ or /store/ or even just /go/.

Think about calculators. I haven't had nearly as many scanners as I have had calculators. TI, and HP for RPN. How do they work? Type in a number and press a 'verb' key like 'Log' and you get the log of that number.

My daughter has a new TI 'graphing' calculator that 'helps you' by requiring that you enter the formula as it is written on paper. I struggled with it for a while because entering a number and pressing 'log' just got me error messages. What it wanted was 'Log 123 =' I guess that IS the way it was on the paper, but not what I was used to.

I also do website design at work and we struggle with UI a lot. We're constantly trying to find analogs people might guess at for functionality while at the same time advancing the 'cool' factor. Helping my mother with her Yahoo mail account and their constant UI changes really sucks the 'cool' out of the UI.

My point is this UI stuff is really hard. Logically, my daughter's calculator is more intuitive because it accepts the math as it is written down. For me, it's terrible because of history.

I too have oodles of trouble navigating the '396's UI but I have to assume smarter folks than me have a plan, and I'm still trying to drink the coolaid.

Keep in mind that this "basic function" was non-existent until the DMA scanners in the Uniden world. Scanners traditionally had no VFO (which is the basic function I believe you are talking about). In fact, no commercial radio has this "basic function" either. Pretty much only ham radios have had it. And I understand your view coming from the ham world, but what is basic to hams is not basic to anyone else.

So, they ADDED the "VFO" feature, but how? Well, you can't hit FREQ-ENTER because that enters a frequency. That leaves the following keys: MENU, FUNC, SCAN, L/O, and HOLD. Of those which is the most logical? You want to HOLD on a single frequency, so it's FREQ-HOLD. And BTW MENU is used for the Number Tag keys and SCAN scans and L/O clears, so there weren't many options available.

I don't see how it could have been made more simple without adding another button just for that feature.

But again, be thankful the scanner has that feature at all, as it was not historically a common scanner feature.

Not trying to pile on, but I have to agree with the OP. I think Uniden has tried very hard to provide a useable interface between the newer, highly complex public communications systems and those of us wishing to listen to them - but that interface, in the case of the 396, just doesn't cut it. I've owned and used scanners since the early '70's and spent 27 years in IT as a developer and manager of developers, and I rarely turn on my 396 because it just isn't worth the trouble. I'm sure that if you have hours and hours to spend not only learning it, but also to continue working with it constantly so as not to forget the countless unintuitive keystroke combinations that you have to know in order to actually *use* the radio, then it's a miracle of modern engineering. For those of us who don't listen "professionally," it's just not practical. I have software and I don't mind using it; I don't know how anyone could attempt to own a scanner today and not use software. BUT, I should also be able to add a TG or modify an existing setting in the field without fear of doing something wrong unintentionally.

I love the fact that Uniden has continued to build scanners when most of the market has disappeared, and I applaud them - seriously - for attempting to give us a radio that can keep up with the systems being deployed today. The economics of doing that have got to be difficult. I *want* the next Uniden scanner, whatever it might be. I don't want a Home Patrol that takes away my ability to have full control over the radio, but I do want a handheld with enough buttons and enough meaningful labels to make it useable when I might not have touched it for 6 months. I believe that will only happen if Uniden gets more end users involved during UI development, rather than limiting it to the few people who work with this stuff all day, every day.

Mike, KC0KBC

and brian, i had calculators firmly in mind when i wrote the earlier posts. i bought (for an astronomical sum!) the first hp programmable calculator, the hp-55 back in the mid 70s. so i started with rpn which has a stack and an /enter/ key to insert or push numbers into the stack. many people who started with rpn had trouble with algebraic and vice versa--i never did. i own about as many of one type as the others and switch among them with ease. the reason is that the keyboards and key labels support the internal logic. that's what i'm arguing about the 396, that the key labels don't always indicate the function they perform.

full agreement, obviously mike. i have carried the 396 and the 396xt everyday for the last half-dozen years. i've read every scrap of documentation i could buy or find on the web. many documents several times. but there's just too damm much to try to remember. which is where a semi-intuitive interface can act as a 'jog' to your memory. this is where the 396 falls on its face, imo.

and we are not the only folks concerned about locking up our scanners by using the keyboard out in the field away from our computers and reference material.

so how about this? a firmware update to have the 'No(.)' key act as a global 'escape' key. hold it for 2 seconds and and it either backs you up a step or returns to scanning or searching--actually _anything_but leaving you inside an entry field or a menu with no way out. having that peace of mind, perhaps many more people could actually try to use the keyboards without fear of getting locked up or locked out and so far out in space that ufo's couldn't bring you back. [g]

the lack of a vfo (which has cost bearcat many thousands of dollars of my money over the years) is an attempt to dumb down a radio to the great unwashed who might want scanners but too scared of real radio to purchase one. a radio like the 396 should not be dumbed down as it is marketed as a 'professionals' radio, not as a casual trunked entry-level scanner.

Sorry to rehash but using the keypad can be done. It really isn't that hard once learned. Again, sorry. The keypad is not the enemy.

Correct, its overanalyzing that's the problem and makes it harder than it should be. Every function of the scanner is available through the function keys/keypad or menu system and shouldn't have to be memorized.

Sorry, but every scanner I've ever owned had this feature. On the
Uniden Bearcat 100XLT you pressed scan then typed the frequency and
pressed enter. On the AOR 8000XLT you pressed VFO then typed the
frequency and pressed enter.
Pressing Hold is not intuitive, because you think of it as a toggle,
you worry that when you press it a second time, you will lose the
frequency you just typed, and it will resume doing what it was doing
before.
A better (but slower) method would be to have a menu item called
"SINGLE FREQUENCY", which when selected would prompt you for the
frequency, then you would press yes.

Yes, AOR has had VFOs. I don't recall the feature you mention on the
100XLT or any of the models in that series.

Maybe just enable scanning of your Quick Save System and use the
FREQ-ENTER scheme and hit SCAN.

The biggest reason is during an incident everyone goes to their phone and tie the networks up. Happens in every major incident and will continue to happen. The same happens on trunked radio systems too. During the week of the super bowl in Indy the phone and radio systems were both overloaded numerous times, it almost cost one man his life as EMS couldn't be called when hr had a heart attack. Someone finally got ahold of a trooper who was able to get on the statewide system and get help but even then the EMS crew couldn't get on the cities P25 system.

8257. Re: [BCD396XT] emergency single freq entry method; setup, and icom vs Uniden 3 steps to random freq vs 4 steps.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-08-25 21:26:28 UTC
From: chris451
Topic: 8224 Message: 8257

Here is the long method to enter a random freq into the uniden.
See farther down to get the 4 step method that requires setup ahead of time.

18 step method_____
hold
Menu(left side lower button)
enter on program system
select system roll ccw to new system
enter
select conventional by rotating dial
confirm yes
edit group
new group
edit channel
new channel
input frequency
146.940 enter
press hold
processing
Now on freq group1 system 216 (or something greter than 1) freq displayed.
add another freq
enter
roll to new channel
input freq
162.475 enter
press hold
displays freq....roll dial to alternat to 146.940 or whateve you put in.

4 step method setup_____
To shorten that up with quick keys:
assign the quick key 3 to a conventional system lets call it vfo
hold
program system
new system
edit name "vfo"
edit group
new group
group 1
edit channel
new channel
162.475
hit menu until Edit system options
set number tag 99
(if it exists try til you find an unused one or say yes assign it here)

Now scan.....

Now that I set that up how many steps to put in VFO channel?

I have my 396xt here, these steps are from the scan mode and allow a quick freq entry
I spent a few days learning the firmware with a new discovery every few weeks.

Without prep these steps allow a random freq entry without messing up something else.

4 step method to enter random
freq_____
hold
99. (three plus decimal)
left side menu button
(shows a previous freq in that system
hit enter and change the freq or add another by rolling down
enter freq
hold
You are now receiving that freq. So now thats down to 4 steps (not including setup for the vfo bank)
Scan.....if you get stuck on that channel such as national weather that goes all the time hit lockout....

OK so now thats 3 steps vs 4 steps and one time setup. Different but not bad.
Practice that 20 times and sleep on it.
I'd offer you a beer but I'm probably in another town than you.....oh thats a good idea. I skipped lunch.
Chris

On a traditional "icom reciever" such as R10 to compare these steps:
clear
type freq 162.475
enter
(m/vfo roll to channel mem write)
yes thats three steps, or 5 if you write to the channel you are on.

8258. Re: [BCD396XT] Fringe trunking (notrunk)

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-08-25 21:31:15 UTC
From: chris451
Topic: 8224 Message: 8258

Just for fun I put in all the talk channels of a P25 system, then lock out the control channel.
Programmed it as a conventional.

In the fringe (distant zone) I find I can pick up most traffic this way due to the fact the trunk channel
will not decode in the fringe, but the P25 will. Perhaps that is because there is error correction on the
speech coding and it decodes great, and there is minimal or no error correction on the control channel.

Also when using a dicriminator tap and a conventional scanner with the software decoding, now the
trunk radio performs as well as just "Notrunking" the talk channels, in areas where the control channel is not locked in
(system ID will not display when holding on control channel)

How fun as it greatly multiplies the coverage (as long as you dont mind getting everything rather than just interesting channels).

8259. Re: [BCD396XT] emergency single freq entry method; setup, and icom vs Uniden 3 steps to random freq vs 4 steps.

Here is the two-step method:

1. Input the frequency.
2. Hit the HOLD button.

Example: 162.550 (HOLD)

If people can't remember that, they have no
hope of remembering something any more complex.

8260. Re: [BCD396XT] Fringe trunking (notrunk)

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-08-26 04:20:09 UTC
From: Jeffry Rehm
Topic: 8224 Message: 8260

Very cool idea. Thinking outside the box is sometimes productive. Kind of like listening in on an older analog trunking system on a non trunk tracker scanner. Just throw in the frequencies and listen. And to find out you get, for the most part, better/farther reception. Cool.

Subject: Re: [BCD396XT] Fringe trunking (notrunk)

Just for fun I put in all the talk channels of a P25 system, then lock out the control channel.
Programmed it as a conventional.

In the fringe (distant zone) I find I can pick up most traffic this way due to the fact the trunk channel
will not decode in the fringe, but the P25 will. Perhaps that is because there is error correction on the
speech coding and it decodes great, and there is minimal or no error correction on the control channel.

Also when using a dicriminator tap and a conventional scanner with the software decoding, now the
trunk radio performs as well as just "Notrunking" the talk channels, in areas where the control channel is not locked in
(system ID will not display when holding on control channel)

How fun as it greatly multiplies the coverage (as long as you dont mind getting everything rather than just interesting channels).

Has anyone successfully programmed this new system into their BCD396XT by downloading from radioreference.com? I'm specifically interested in Fremont PD, but don't seem to be picking anything up. I'm wondering if their is an error in the file from radioreference.com

Thanks, Steve

Your report should show to the moronic ham radio operators that YES,
encryption is needed so the agencies have that to fall back on. I have
gotten sick and tired of everybody on RR stating that radio systems and
cell networks won't fail.

I'm curious how encryption or ham radio operators have anything to do with the conversation since neither are commented on previously. Seems that post was completely off topic...but then the thread was to begin with. However scanning during shore bowl week was interesting at times. One officer on a mutual aid channel said " well can't get on the system with the radio and can't use my cell either so I figured I'd try this channel. Problem was no one was monitoring that channel who could help him.
Oddly enough a TV channel report on the super bowl week pointed out this radio and cell phone problem but they were left out of the cities report until brought up by the TV station and in a revised report these incidents suddenly appeared. Seems some things were left out by the department to make things sound better. Also missing was the destroyed police car at a concert. That too suddenly found its way into the revised report.

encryption has nothing to do with channel availability. Anybody that thinks the cells phones and radio channels don't get over loaded during major events either isn't paying attention or never been involved in a major event of any sort. The cell phone channels get overloaded on mothers day to say nothing of floods, tornadoes, or hurricanes, all of which are sure to take down towers where they are most needed.

As a moronic ham radio operator
(KD0WBO) I have first hand knowledge about the way these systems work.
First of all encryption has nothing to do with channel availability as
previously stated. Second if you think public safety radios need
encryption you have another thing coming., By encrypting public safety
you are asking for major problems when things turn bad. In major events
its best to keep systems simple and adding encryption which is not
necessary for public safety your asking for failure. The system in
Indiana failed because of bad planing and infrastructure and there are
still may agency's that have yet to upgrade to the digital systems. When
all public safety systems fail and they will it will be the moronic ham radio operator that
will come to save the day so don't rip on the ones that keep all these radio systems
working.   --- In bcd396xt@yahoogroups.com, <scooterdog13@...> wrote:

First: I've been using scanners for many years and don't want to see everything becoming encrypted; however:

Encryption for law enforcement has been around for a long time and in my experience, primarily used for special operations – I personally installed an analog voice scrambling systems for a NC State Police drug enforcement team in the 1970's; MA State Police have encrypted channels, Coast Guard routinely uses encrypted transmissions for offshore operations on VHF Marine channels, encrypted ACARS transmissions from Aircraft are becoming more common in the US on VHF – and that's only a small sampling.

With the advent of digital communications encryption becomes easier (a single chip) and is virtually unbreakable (unless, of course, you're working for NSA!). Unfortunately for scanner enthusiasts, myself included, I think encrypted voice will likely become more common among law enforcement and fire departments as we move forward. Sorry about that…..

The Indianapolis system failed because of too many people talking needlessly about useless stuff that had zilch to do with the events going on at the time. I know because I had 5 scanners scanning that one system when the guy had the heart attack and no one could get on the radio. At the same time no one could use their cell phones either because the systems were so tied up and that was with extra portable sites brought in just for the super bowl. Even the statewide radio system was at near capacity with its three Indy sites.
The city us known for bad planning, instead of making certain schools police and fire have what they need they throw $20,000,000 a year to the useless Pacers and have to lay off teachers close schools fire stations and not replace fire and police who retire or get arrested. Indy has had a dozen police officers arrested in the last two years for DUI! Even a couple firefighters too. Two police in the past two weeks arrested. No money to replace them, no new class of recruits will be ready until 2014. And they can't even pay to fix damaged police cars or replace worn out cars. Why? Poor leadership! Mayor Ballard combined the police and sheriffs departments to save $$ and it ended up costing millions more. Ballard wants the Pacers so HE can go to the games free, so the city dumps millions into a losing effort. Then Ballard decides in the midst of a lousy economy to try and host a super bowl. At the same time Motorola is pitting the screws to the city. The new radio system would cost millions more and be less than the contract called for. They ended up with a P25 system but instead of desperate sites as the contract called for Motorola talked them into a simulcast system. Worts thing they could have done! Now you just tied up the entire system. They kept the original systems number of channels but did add two X2 data channels for the MDT's. What's worse is the "backup" system is essentially the exact same system with a couple different sites and different frequencies! Effectively it is one system split in two. One used by public safety the other by public works. Coverage on system 2 as its known is even worse than system 1.
Add to it the city should have known the systems vulnerabilities long before the super bowl as they had "issues" long before that with normal events but ignored the warnings. The city was too busy wasting millions on useless projects for the super bowl to worry about radio problems. One project was to use a run down mall and turn it into a joint comm center for city, state and the feds during the super bowl. Between a 30 year lease and other costs or cost around a hundred million for that ONE item to be used rarely although one tiny section is now home to IMPD East District.... then there were $300,000,000 in other useless projects including shutting I70 down to plant trees so super bowl fans didn't see bare grass! Bad management? No question, in fact there is a serious lack of common sense in the city county building in Indy. It showed with the state fair collapse and the South Side explosion too. And yet today the mayor still refuses to admit there are radio issues or a crime issue either.....

Law enforcement, yes. Already seeing that trend over here. Fire? Not
necessarily. In less populated areas, there is a lot of monitoring of
fire frequencies by both the general public (including owners of private
fire appliances) and volunteers, and this is seen as generally a good
thing. Horses for courses.

Not sure either..lol. but around here encryption is rare. A couple Indiana counties use it and one ISP unit south uses it but otherwise everything is pretty much in the clear. Locally the sheriff is anti encryption as he knows people like myself listen, and on occasion help them out. If we had encryption here I wouldn't have gotten a small town bank robbers description, a week later I saw a guy who matched it and called and it was him. Not too long ago the dispatchers were getting nervous when they couldn't hear an officer, but I heard him fine so told them they were OK and the rest of the traffic stop they listened to my scanner over the phone so they could hear the officer! Things have been tense here since a traffic stop last year when an officer ended up in a pursuit and was shot. He is back to work now, but that night everyone wondered if he would make it. Especially those of us who heard it all first hand. Add to it it was the second night in a row with officers shot in our rural area.

I did send an obvious sign on the bottom of my message. :D I'm in
Australia. In Melbourne, the police have been encrypted since 2006
(their network was upgraded in time for the 2006 Commonwealth Games).
The encryption hasn't spread to the rural areas yet, this far out of
town they are still running analog FM.

John, my personal opinion is that political discussions have no place in a forum dedicated to a particular model of scanner.

My opinions aside, your arguments would carry more weight if they were factual. The Indianapolis Police Department and Marion County Sheriff Department merger was approved by the City-County Council in 2005 and occurred on January 1, 2007. Bart Peterson was Mayor then.

Greg Ballard became Mayor on January 1, 2008.

Motorola Solutions, Inc.(NYSE: MSI), today announces the launch of the new MOTOTRBO CP200d: the digital-capable version of the best-selling CP200 portable two-way radio. The CP200d makes it easy to transition your business to digital technology. It delivers the easy-to-use features, form factor and batteries of the CP200 portable, while adding digital voice capability. The radio can operate in digital and analog modes concurrently and fits seamlessly into your existing communication system, allowing you to migrate to digital at your own pace.

Dear brey1234,

Ray_Air has just replied to a thread you have subscribed to entitled -
Cumberland County - HARRIS RF COM - OpenSky System - in the Pennsylvania Radio
Discussion Forum forum of The RadioReference.com Forums.

This thread is located at:
http://forums.radioreference.com/pennsylvania-radio-discussion-forum/74576-c
umberland-county-harris-rf-com-opensky-system-new-post.html

Here is the message that has just been posted:
***************
Any STARNet OS users on here ? How is your system working?

Oakland Co. Michigan uses OS also. They first started installing it in
2002
Our system gets the calls handled but I still notice problems:

-The loudness of the calls varies from call to call.

- Occassional nasally sound

- Received transmission starting good but last few words are unreadable
and echo about three times. ( I have recorded proof)

We still have some of the old Tyco Electronics P7200's and M/A Coms.

I've been on the system since 2009. Northern Oakland Co.
***************

There may also be other replies, but you will not receive any more
notifications until you visit the forum again.

All the best,

OK Here it goes. I received an "illegal voltage" message on my 396xt. Everything was working fine last night. I checked the lovely Uniden operators guide for the scanner and all it shows are the different messages on the screen when the batteries are used etc. However it does NOT tell you what to do when such a message appears.

What am I supposed to check so I can fix my problem?

Trying to determine if it is the charger or maybe the plug inside the scanner.

Please help.

I think I'd call Uniden . My seat of the pants reaction is your charger may be over voltage. I messed up my 296 when I put a 9v battery in it while at NASCAR, hammerhead at Racing Electronics said " oh we do it all the time! " radio was never the same after I did that. Learned a tough lesson on that one. So call Uniden tech support and get good advice by people who are paid to know. Imho

When the voltage of your charger falls outside a predetermined range you will get the message illegal voltage. It may be high or low outside of about six to about 7 Volts.

You likely have a charger issue.

First, make sure you're using the correct charger.

Next, do you have any friends who have the same (or similar) unit whose charger you could try on yours, or your charger on theirs? That would tell you if it's the charger or the scanner.

I would suspect the charger, but also try it with and without the batteries installed.

Anytime. I didn't mean to criticize about the charger.
Sometimes people do mix them up. But, yours could have gone bad.

It's easier to replace the charger than have the scanner repaired.

Sometimes it's dependent on where you have the
charger plugged in, too, such as in an inverter.

I have just ordered my BCD396xt and hope to have it Saturday. I figure it will be easier to program with software rather than the unit... ??? If there is a good free software that makes it easy please let me know. If not I will study the entries here on how to program them.
thanks,
Shannan

UPMan gave you a great list of programming software choices. Just remember that if you choose free software, a donation
is always welcomed by the author. Almost all of the programs have a free trial version so you can decide for yourself which
you prefer.
Also, remember that you just paid several hundred dollars for the scanner, so free software might not be the way to go if a paid
software program suits you better.

Can someone tell me if it is really worth the extra $ over freescan?

Also as a new BCD396XT user, I am having trouble decoding a lot of digital transmissions. For example, Westfield shopping centres in Melbourne Australia I can't seem to decode. Maybe they have a high level of security on their radios.

Regards,

Ben.

Try freescan.... as it is free to try.

I used to use another one for another scanner but chose to stay with freescan and use the $$ for a donation and a year subscription to radio reference. I would certainly recommend RR....especially if you are new to this.

Freescan imports directly with 2 choices.. analog or digital. Both work fine.

Example... I am getting ready for a quick trip. I was able to pull up freescan, login to RR through freescan... get the systems in the city I was going to visit... upload to 396xt with its own quick key... pack scanner in under 5 minutes.

When I get home... I will just, via freescan, erase and reload my "daily use" load.

At the same time... I am always on the hunt for better software. I liked the comment UPMan made.
For me... I like trying everything just for the fun of it. I enjoy "finding" great programs.

8302. Programming Elmer in the Sacramento/Bay Area?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-09-07 18:36:05 UTC
From: <overthepole@...>
Topic: 8302 Message: 8302

Morning,

Say, would anyone be willing to spend a few minutes on the phone answering some programming questions for me? I just got my BCD396XT and I seem to have the conventional world working, but have a few questions on the digi side.

For example, I have a digi system set up, when I TX on one of the freqs, the scanner shows the title and signal strength but doesn't open the squelch. If I hold on the same channel and TX, the audio passes. Not sure why it doesn't stop in scan, must have a bit flipped. Also could use some help understanding the various tags, ID's, quick keys and such.

I downloaded the various manuals and helpers that folks have penned and that got me going. I figure a few minutes on the phone would save a few hours digging and trial and error etc.

Any help appreciated, you can answer offline if you prefer. Thanks!

Only you can make that determination. ARC XT-Pro has a 30-day free trial, so give them both a whirl and see if the features or ease of use are worth it to you. I originally had issues with Freescan displaying properly on my laptop which turned out to be my DPI setting for my display. Not knowing what the problem was and needing something in a hurry, I spent the $$ for ARC XT Pro and I do like it very much. If Freescan had worked properly on my laptop from the git-go, I probably would have stuck with it instead of spending that much money.

Agree on the concept, and down here there's a whole swag of trucks to choose from from all over the world! :) As for scanners, I use Freescan, because I like it, it does what I need, and hasn't let me down. I concur with everyone else's suggestions. Try one (or better yet, both) of the programs suggested, weigh them up, see which one best meets your needs (features, cost, etc), and settle on that one.

Maine has a Sheriff's Dept. listed under York County that uses VHF High Band frequencies. It appears to be a conventional system with possibly one exception... One of the frequencies listed uses a NAC type of PL. My question is does this frequency need to be programmed as a single channel trunked system? Or do I just plug in the NAC code under the column provided in my Butel ARCXT PRO software under a conventional system along with the rest of the conventional frequencies? I do not live in the area, only visiting a couple of times a year and won't be back until next summer. I just like to have my 396XT programmed before I leave home instead of waiting until I arrive. I then either verify that RADIOREFERENCE data is good, (provided I didn't make a programming mistake) or its in need of a correction notification consideration. But my question is general in nature... The fact that the software allows for a seperate heading for NAC, instead of grouping it in with the CTCSS and Digital Codes causes the concern. For some reason NAC is not treated in the same fashion.

Bill

My bad. I discovered I had connected a 500ma charger from my 246T scanner instead of the correct 800ma charger that shipped with the 396XT.
Sorry about that.
Gary

UPman thanks for the link and suggestions... Clark, I agree. I bought my scanner about 100 less than they sell for and am ok with using the extra savings for good software. Alot of times there is free software for alot of things we buy so I thought maybe there might be for this too. This is a niche interest so that may not be the case here. I have found that I like the instructional videos on ARC XT I found on youtube. I will probably purchase that unless anyone has tried it and has something else they think is better or easier to use for the novice/new user... Once again, thanks for all the posts... Whatever I use I plan to post some youtube vids to show how to use and promote the product. Sorry I didn't post sooner, I think Yahoo groups were down for a while this afternoon...

Dear All
Please advise. I live outside the USA and I own the BCD 396XT. So the trunking data in this site is not useful for me (is it true). I need to program the trunking frequencies by myself. who can help by posting the step by step instruction? I live in the middle east.
Thanks !!

8318. Question on comparing the HP1 to the 396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-09-10 11:15:31 UTC
From: Bill
Topic: 8318 Message: 8318

I just got my HP1 back from UNIDEN repair. I dropped it and bent the antenna connector. I asked that the front panel (cosmetic damage) be replaced and the antenna connector be straightened and the radio to be checked for proper operation as it did not seem to receive as well as my 396XT. So I set the HP1 next to my 396XT and noticed very descernable white noise along with the signal on my local PD freq on the HP1. The 396XT received the same signals without the white noise. The HP1 also is displaying an odd audio problem - it sounds like feedback one would hear when listening to a transmitter that is in close proxcimity to another receiver, sending both the originating transmission and picking up the audio of the receiver close it it. I turn the volume down to try and eliminate it, thinking I am overloading the audio section with a strong signal but in some cases it does not work. I never had this before I sent the radio in for repairs, both before and after I dropped it. The radio did not give me the feedback effect after the drop, my asking to have the receiver checked in additon to the cosmetic repairs was just something I expected it would need after the new antenna connection work was performed.

Anybody else seeing differences between these two radios? I might just wait until a newer version of the HP1 comes on the market instead of returning my current one for repair again, sending it in after the new one arrives.

Bill

Hi Bill...

Niagara Falls Ontario Fire has the same sort of set up..

Enter it as a CONVENTIONAL SYSTEM...enter the Freq 15X.XXXX...then go to SET AUDIO TYPE..choose DIGITAL ONLY..then SET P25 NAC..& enter the NAC code and you are all set. I noticed a Sheriff's P25 chanel...York FD & Kittery FD both have Tac P25 chans. & Biddeford PD & FD too have P25 chans. I am wondering if this is for INTER-Op Comms with N.H. Rockingham Depts?

That's just one place, and not always the best for race frequencies, there are better choices in this case.

Hello group!!
My APX7000XE came in on fri. and I had already gotten a copy of the codeplug that I programmed up the local 800 system, and WOW, does it sound AMAZING!!! I can't stress enough how clear it is!! Everyone should go out and get an XTS3000l or xts5000 or even an apx.. It's setup so that it WILL NOT EVER transmit into the system or try to "affiliate".. The audio quality really will blow your mind!

— The city will spend $10.8 million over the next decade to upgrade its outdated public radio system, allowing the police and fire departments to communicate with other city and county agencies without interruption during regional emergencies such as tornadoes.
The state has set the goal that all first-responder agencies' radio systems be interoperable, or able to communicate with one another, by Jan. 1, 2015. To help meet that goal, the Arlington City Council voted Sept. 3 to approve a 10-year lease with Motorola Solutions to buy digital radio equipment that will increase interoperability with other agencies in Tarrant and surrounding counties

Yep! As I regularly say, you really do get something for you your $5,000.

I run a public safety radio system for a living. As such, I have
various radios issued. I also have a city issued BCD396T and a
personally owned BCD396XT and BCD996T scanners. No question that the
real radios work far better than any scanner out there...

That's just one place, and not always the best for race frequencies, there are better choices in this case.

The frequencies can be found with Google search. Officials use nextel and only one is in the clear as it is retransmitted for the teams.

--- In BCD396XT@yahoogroups.com, <bcd396xt@yahoogroups.com> wrote:

Hi Bill...

Niagara Falls Ontario Fire has the same sort of set up..

Enter it as a CONVENTIONAL SYSTEM...enter the Freq 15X.XXXX...then go to SET AUDIO TYPE..choose DIGITAL ONLY..then SET P25 NAC..& enter the NAC code and you are all set. I

noticed a Sheriff's P25 chanel...York FD & Kittery FD both have Tac P25 chans. & Biddeford PD & FD too have P25 chans. I am wondering if this is for INTER-Op Comms with N.H. Rockingham Depts?

--- In BCD396XT@yahoogroups.com, <bcd396xt@yahoogroups.com> wrote:

Maine has a Sheriff's Dept. listed under York County that uses VHF High Band frequencies. It appears to be a conventional system with possibly one exception... One of the frequencies listed uses a NAC type of PL. My question is does this frequency need to be programmed as a single channel trunked system? Or do I just plug in the NAC code under the column provided in my Butel ARCXT PRO software under a conventional system along with the rest of the conventional frequencies? I do not live in the area, only visiting a couple of times a year and won't be back until next summer. I just like to have my 396XT programmed before I leave home instead of waiting until I arrive. I then either verify that RADIOREFERENCE data is good, (provided I didn't make a programming mistake) or its in need of a correction notification consideration. But my question is general in nature... The fact that the software allows for a seperate heading for NAC, instead of grouping it in with the CTCSS and Digital Codes causes the concern. For some reason NAC is not treated in the same fashion.

Bill

8338. Problem with ARC XT software

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-09-21 07:26:36 UTC
From: Beauregard Waller
Topic: 8338 Message: 8338

A couple of years ago I bought the 396XT, plus ARC XT Pro software. It worked fine on my Win7 machine. I installed Win8 as soon as it came out, and the software stopped working , it could no longer locate my scanner. Everything worked fine on my Win7 Laptop, so I did not worry too much. I had heard about the chip issue. So, recently, I decided to get it to run off my Win8 machine. I had bought it from Scannermaster, so I asked them about a cable. They told me about the new Uniden cable and I bought it, and plugged it in and installed the new driver. Things got weird. ARC XT still could not find my scanner, so I uninstalled my driver and did a new install, just in case. No dice. So, I installed Freescan, and it worked fine. I installed Proscan, and it worked fine.

So, why should Freescan and Proscan work fine but not ARC XT????? I took another step into the Twilight Zone. I ran ARC XT again to see if there were some settings I was missing, Again, it could not find my scanner. While I was playing around with it something odd happened. I happened to click on the Scan button, and my scanner beeped, huh??? I clicked on another button, another beep. I pressed the Light button so I could see the display clearly as I pressed the button. When I pressed Scan, it started to scan. When I pressed Hold, it went into Hold mode. Just for fun, I clicked Menu, and it went into Menu mode.

It seems that I can send data TO the scanner, but not receive data FROM it. I can remotely control it, but I will not know what happens unless I look at the scanner as there is no feedback to the computer. Does anyone have any idea what is going on?? Has anyone ever encountered this issue in this manner??? Since I have paid for this program, I want to see if I can get it to work before abandoning it for a program I KNOW works.

Any ideas, thoughts, suggestions, etc.

Thanks,

John Waller

I can't say what is causing the issue, but I can say I've heard of the exact same thing from several people. I suspect it may be a driver/SW incompatibility issue, but I don't know for sure.

I have the same problem with my windows 8 machine, the driver update is one issue, their software won't work on the new driver according to the email I got from arc tech support. They also went on to say it wasn't their issue take it up with microsoft. My guess is he stands about a 99.9% chance of being right, it is a microsoft issue but they should be working with microsoft to get it resolved not kicking it back to the paying customer to resolve.

Check in Device Manager to determine which port is being used. You may need

to set the port number in ARC XT Pro to properly connect to the scanner. On my Win 8 computer, sometimes Freescan would find the port, sometimes it couldn't. After I set the port number it finds it every time. Might be worth a try.

I had a similar issue. ARC-XT would not work with the USB-1 at all in Windows 8 but it worked fine in Windows 7. Weirdly, it worked with FreeScan though. I got it to work with ARC by getting a new USB to serial adaptor and used the older serial cable to the radio.

Gommert worked with me on this and it looks like there is a driver issue with the USB-1. While Windows 8 sees it and assigns a port number it doesn't become available to some applications.

I was using a MS Surface Pro if it matters.

8344. Good luck with Butel

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-09-20 23:09:29 UTC
From: RJH
Topic: 8344 Message: 8344

Hi,

Sorry to hear about your problem. As Joe said it's probably a driver issue. I say revert back to Win 7 for as long as you can. I am not a fan of Win 8, nor are most people.

I have the HP-1 Butel software and the 396 T Version, both are the clunkiest software I have dealt with. Good luck with support. I have issues with the ARC Patrol they said they would fix and they never did.

Scanner Master, which used to be a big proponent of Butel have kind of backed away from them, due to the lack of support. They are near me, so I go over there from time to time and they kind of chuckle about Gommert and Butel.

Let me know how it goes.

That usually means it's seeing the converter chip present,
but the chip is not correctly converting the data to serial.

This could be due to the driver or SW (both as I mentioned before), or
it could be due to the OS which someone had mentioned that Gommert said
the issue was (which is plausible).

But, I don't know why it would work with FreeScan if it's an OS issue.

Bob,

http://wiki.radioreference.com/index.php/BCD396XT

See the easier to read manual for the BCD396XT:

http://marksscanners.com/396XT/396xt.shtml

Most likely want to use software and a cable to program,

This article from Uniden's Paul Opitz about trunking is good reading:

http://wiki.radioreference.com/images/c/c7/Trunking_description.pdf

This article from Uniden's Paul Opitz about scanner programming is good reading:

http://www.grove-ent.com/SCANNERPROGRAMMING.htm

Also take a look at the following about Uniden Dynamic Memory Architecture (DMA) scanners:

http://wiki.radioreference.com/index.php/Uniden_DMA_FAQ

Hope that these help,

Scott

Wow.

I've had ARC software for my Uniden 780, 996T, 996XT, 396XT, Icom R-20, AOR AR-5000+3 and now the Home Patrol. The only issue I've ever experienced was as a beta tester for the R20 and, of course, Gommert addressed it. Always installed and ran without a hitch.

I wonder how Scanner Master is going to react to your comment.

Seems odd that someone with 396T version of ARC which he describes as".clunkiest software I have dealt with" would go ahead and get HP-1 Software from same vendor. And then whine about it also. Did you not learn from Einstein that you shouldn't do that ?

Hi,

Sorry to hear about your problem. As Joe said it's probably a driver issue. I say revert back to Win 7 for as long as you can. I am not a fan of Win 8, nor are most people.

I have the HP-1 Butel software and the 396 T Version, both are the clunkiest software I have dealt with. Good luck with support. I have issues with the ARC Patrol they said they would fix and they never did.

Scanner Master, which used to be a big proponent of Butel have kind of backed away from them, due to the lack of support. They are near me, so I go over there from time to time and they kind of chuckle about Gommert and Butel.

Let me know how it goes.

Okay, the problem is fixed for now, I heard from Butel, and his solution is: turn off automatic driver updates, install an older drive. I did this and it is working fine now. Whether having the driver updater off is going to create issues, I do not know. I do have a 3rd party program that updates drivers for me, so we will see :) I will also continue to research Freescan and Proscan, and any others I may find, to see if there is one I would prefer over ARC XT.

Thanks for the help and advice..

Subject: Re: [BCD396XT] Problem with ARC XT software

That usually means it's seeing the converter chip present,
but the chip is not correctly converting the data to serial.

This could be due to the driver or SW (both as I mentioned before), or it could be due to the OS which someone had mentioned that Gommert said the issue was (which is plausible).

But, I don't know why it would work with FreeScan if it's an OS issue.

Every so often my scanner starts scanning/searching the Public Safety band. I am sure I am some how starting it but more importantly I do not know how to stop it. I've tried going through the menu but nothing seems to work. Any help is greatly appreciated. I get a lot of the motorboating noise and it is very annoying. I do not want it to scan search the Public Safety band. I use FreeScan and have looked for a way to shut it off there but I have not been successful.

Thanks in advance for your help.

Mike

When it is searching the PS band, hit
"FUNC L/O L/O" and it will lock it out.

8359. BCD 396XT No longer hears New York State Electric & Gas

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-09-23 14:20:56 UTC
From: Robert Arenella
Topic: 8344 Message: 8359

Posted this to RR forum, but would like more opinions. I recently noticed that my 396XT no longer hears New York State Electric & Gas (NYSEG). I see 3 or 4 bars on the signal strength indicator, so it is hearing the CC's. No problem hearing them on my HP-1, 996T or my PSR800.

Two or three weeks ago, I noticed that the SMA connector was a bit loose. I have the proper tool for those nuts and snugged it up. Using ARC XT, I deleted the system, then imported it from Radio Reference. Still no joy. As per the suggestion from a RR member, I downloaded Freescan and tried again, without success.

I finally decided to try my outdoor antenna. It's an Austin Ferret fed with LMR400UF into a Stridesburg Multi Coupler. VOILA!! now it was hearing NYSEG as it always did. Then I remembered the loose SMA connector.

I opened up the scanner to take a look. With good lighting and plenty of magnification, I still couldn't see much, but didn't see anything obvious at the connector. I'm going to remove the SMA nut and that should let me separate the smaller PCB board from the larger one, and provide a clear view of the SMA connector and what it's connected to. Hopefully an easy fix and I can avoid a round trip to Texas. Sure hope it's not a cooked FET in the front end.

Anyone ever experience a problem like this with a 396XT?

Thanks,
Bob Arenella

Ah, a permanent lockout. Had not thought of that. I did L/O and Func + L/O
and it still kept going.

Thanks. Appreciate the help.

Func L/O should have worked until you reset the power.

Make sure you are on that search when you press FUNC.

If your outside antenna works fine then you should be looking at the antenna on the unit, since both signals went thru the same SMA connector. Maybe you could borrow one to check it out before tearing into your radio.

Unless the outside antenna is providing enough
signal strength to overcome a damaged front end.

I would start by testing the sensitivity
if a signal generator is available.

Also check the pin on the antenna (just in case).

Sounds like you are on the right track. The soldered antenna connections should be inspected, but AFTER you have tried another portable antenna you know is good. No sense going to all the work of opening up the radio if not necessary. I have experienced this same problem but not on the 396XT. Worse comes to worse and you have to send it in, the repair price is not bad. They fix just about anything for a flat fee. All you have to do is resign yourself to the fact it will take a month or two turn around time. (I just got my HP1 back after a month and a half-had them put on a new front cover and straighten out the antenna connector plus check the radio as I didn't like the weaker reception when compared to the 396XT, thought there was something wrong. I suspect they did a re-alignment and set the selectivity differently than when new. Now I get a squeal on strong local stations sometimes. Haven't tried the antenuater yet... If fear if I turn it on it will attenuate all channels. I'm going to wait until UNIDEN comes out with a newer version of the HP1 before I send the current one in again.

Bill

After checking it on some local LE freqs, you may be right about front end damage. I can hear the local PD signal, but they are only about 3 miles from me & have a very strong sig level here. I can sometimes hear them on my handi talkies without an antenna. I can't hear the County Sheriff without the outside antenna and they are about 8 miles away.

I have at least 11 SMA antennas, and unless they are ALL bad, it's either a lousy / bad connection or a smoked front end.

I use this portable about once a week, usually when we go out to dinner. Pampered from day one, I'm not not exactly happy with this situation. I have a Standard C558A Dual Band Handi Talkie (Purchased new in the early 90's, $550) That still looks like new and works perfectly, and it gets WAY more use than the scanner.

8367. Question for someone...out there, over there, ya you get offa my cloud!

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-09-26 01:46:22 UTC
From: yak_yak@sbcglobal.net
Topic: 8367 Message: 8367

Hey just wondering why my BCD396XT with the latest firmware would be changing the last, I would presume its the KHz portion of the frequency to a 0 instead of a 5 like its supposed to be - when I change it and then upload it to the unit it works and the system is crystal clear, however when I download the database to work on it and then upload it back into the unit it's changed and so it the audio sounding from the channels as well as the receive distance. I posted some screenshots of what I'm referring to here to the group archives (I'll delete them after a bit of discussion)

http://f1.grp.yahoofs.com/v1/rJBDUlpKVj8cgHDCF4b-Hl6bmW9g0YEJYIfKDuHEvxyigOOkALX3QOFh6IasdOHDPzxZ2LqfCEbspS7ThcEJXSN-zjpuc4Ny83Xn9wfG594QqCHO/ebrr_2.jpg

http://f1.grp.yahoofs.com/v1/cJBDUosF2JL7rvWcqvTGeFFXP6ImSgaxpKygtlVDQTLeZzRyxaBw1QbD7MSAfZnoUxd8lOwLVlDZevczsuAwyQslcZBclRjc8vn2Z8Ctc9Ltzkaw/alco_ebrcs1_screen2.jpg

any help or info on why it does this would be appreciated!

You didn't say what SW you are using, and your pics come up
"document not found". Could you give some more specific examples?

I found your pics directly on the group. It looks like it may be a bug in FreeScan. Make sure you have the correct step size selected (6.25 kHz step). BTW, that is the 10s of Hz digit.

What is it showing when you re-upload to the scanner?

Yap forgot yo mention it Is Freescan in using - :) - Ive tried manually adding directly to.the radio and it serms to change it. For some reason I'm thinking it might just be the IC or IF of the individual radio now lol -

The last digit represents 5 Hz, which is insignificant to reception. The scanner itself truncates that last digit.

Typo. 50, not 5 (still not significant to FM reception).

In addition to what Paul mentioned, make sure the step size is correct.

If it's truncating the last digit, no issue. But if it's changing the
frequency otherwise, it's a step size issue.

Insignificant to reception, yes, but I bet the scanner PLL still tunes
to the correct frequency, right? IOW, only the display is truncated)

Awesome well asked and answered! Tyvm for all the input. It was just a little weird to me because that's the only group it does it too. And another neato thing I found (which might actually be old news) is when u add a p25 type system u only need to add the control freqs for each site and it will actually scan the appropriate freqs decoded from the stream u don't need to put each and every freq into the grp - and using this method seems to work even better with the location based / multi sites per system.

Most likely either your Priority channel or Weather Alert setting. Check
your manual.

8379. knock, knock..

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-10-01 02:34:14 UTC
From: yak_yak@sbcglobal.net
Topic: 8379 Message: 8379

Hye all..just a question and it might have been answered already but the problem is I find a bunch of different answers ...and most make sense lol - but when all else fails...ask the professionals!

and the question is> on my 396XT I have a system loaded (http://www.radioreference.com/apps/db/?sid=5317) which is listed as a " System Type: Project 25 Phase I
System Voice: APCO-25 Common Air Interface Exclusive" and using FREEScan I put the system in and it works just fine - HOWEVER being the tinkerer I noticed in the "AudioType" column their all marked as "ALL" ...so I changed them to "DIGITAL ONLY"...and ya ...can't hear a thing..nada, dead air - actually no air it doesn't even stop on a channel/freq/group it scans the system I can see it doing it in the display but it never stops - (having a HomePatrol-1 sitting right next to it I know their should be something coming through, but nada... :( ) Am I over tinkering and should leave it on ALL or is my scanner dead in some way?>

As usual any help appreciated..this message will not self destruct in 10 seconds, and yes ofcourse there aren't little green men on mars...their taller then us!

The scanner itself has no such channel option for P25 systems (since all channels are always digital for P25 systems). So, I'd suspect that this is a bug in Freescan that is activated when you modify that setting.

hi joe,
Refer to your reply, by doing what you have suggested: would it lock-out only one frequency at the time we hit L/O L/O, or will lock-out band (PS) where the frequency belong to?
thanks!
didit

MCH <mch@nb.net> wrote:

Func L/O should have worked until you reset the power.

Make sure you are on that search when you press FUNC.

Just using the L/O button would lock out a single frequency (or TG).
FUNC before the L/O button would lock out the current System (or Search).

If you want to lockout the entire search, use FUNC L/O

You won't have enough room to lock out
every individual frequency in a search.

it's the first on on the list, above News, in the Freescan Service tab

I looked for that checkbox but it (FreeScan) had
every other band but that.

That is why I asked for help.

From the sound of it. have you checked to see if a
"service search" is

enabled? There is one for the PS bands

If you want to lockout the entire search, use FUNC L/O

You won't have enough room to lock out
every individual frequency in a search.

8396. San Antonio, Tx Programming BCD396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-10-08 21:36:20 UTC
From: <scanmansatx@...>
Topic: 8396 Message: 8396

Upon some research, I understand that the Police, Fire and Emergency Dispatch transmit using a format known as the EDACS ProVoice System in San Antonio, TX.. Does this mean that a conventional trunking scanner will be unable to pick up these transmissions like I have read?

I understand that there is some sort of decoding software that can be used to decode the transmission making it audible to a listener? If so, how would one go about using this software and is it workable on the BC 898T? I am also using Windows 8 and even when attempting to connect the scanner to the laptop, it is never recognized using a RS232 To USB Cable. I discovered this when attempting to download a firmware update to the scanner.

I have also had my eye on a Uniden HomePatrol1 but understand that this also can not do EDACS ProVoice System but can if programmed with a DD Program?

I have been away from scanners for several years and feel helpless at this point as I can not get any frequencies to come in down here. Back in San Francisco, I did not have this problem. I just want to be able to receive transmissions down here..

The following is the link for the programming information.
....
San Antonio / Bexar County EDACS ProVoice

I expect the BC898T has the new firmware to allow for rebranding? And the 396XT can be programmed using the computer with Radioreference.com. But I have seen issues with this with regards to what operating system the computer is running that might relate to any connection problems you experience. I'm sure there will be additional replys to your posting - from those with firsthand experience, that will help.

Bill

Is the DSD program a free download?

Is it Windows 8 compatible?

Do I need a Serial Port?

How is it programmed in to the scanner?

Is it user friendly?

I'm not sure they are going to have a "new" radio. From everything I've seen, they are simply resuming production of some of the GRE scanners with the Whistler or Radio Shack name on them.

If Whistler continues the GRE product line, that's ok too . GRE had some fantastic direction for scanners and usually delivered new technology quickly. It would be great if they released the PSR900 and offer service for GRE scanners.

Im eager to learn the technical specs on the new BCD536HP as well. I've been a Uniden guy for 20 years now and cut my teeth on my BC200XLT, which is sitting next to my bcd396xt.

Maybe at first, but I don't think that is their long term strategy.
Resuming production on the PSR800 and continuing to develop the firmware
will be a nice start. Along with finalizing and releasing the PSR900.
Along with the other PSR series scanners, of course.

Continuing to develop whatever GRE might have had on the drawing board
(if anything) would be the next natural step.

MODERATOR'S NOTE: RadioShack has committed to the 4 models previously announced. This has been confirmed up to the corporate level (stores seldom know what corporate is planning).

Whistler IS going to have their own line. The radioshack rebuilds are not 100% concrete. Judging from what I am seeing AND hearing from the local RS's, Radio Shack is DONE with scanners

This is all very interesting, however, I thought this is a Uniden BCD396XT group.

Why are we posting links to decoy wiki pages for the BCD536HP?

Why are we talking about Whistler/GRE/Radio Shack product plans?

And, before you ask, yes, I've been hitting my delete key.

Bob...

Hi all,

I agree with Bob. This is the BCD 396XT Group can we move the GRE/Whistler discussions to their own group. It’s all vapor ware. I was hoping when GRE went under that would be it, wishful thinking I guess.

No Robert, it’s about keeping relevant information to each list, this topic isn’t relevant

Thanks,

Ray

MODERATOR'S NOTE: GRE was not bought by Whistler. Whistler bought GRE's intellectual property and designs (technically GRE Japan still exists on paper, but is not in the scanner business any longer...or any other business, for that matter).

==========END NOTE==========

Gre has been bought by whistler. If somebody comes in this group wanting info on it, then give it to them instead of what you just said, that is rude.

GRE Japan no longer has any business licenses according to several dealers. GRE HAS been bought by whistler because the IP is still under current GRE business dealings. Don Starr and Chris, 2 very outspoken former employees of GRE, have been confirmed as being employees of whistler now

Topic: 8413 Message: 8418

So the fact that Whistler themselves have said that they "purchased the IP of GRE America" doesn't mean anything, and we are supposed to believe you over them even though they are the company who we are talking about? If the two former GRE employees are now employees of Whistler, that contradicts what you said, as they would still be employees of GRE if Whistler simply purchased GRE. There would be no reason to change their employment. I think it's clear that Whistler purchased the IP (as they said they did) and not the company.

That said, let's PLEASE take the issue over to one of the Whistler lists. The original announcement was fringe on-topic (since it deals with a direct competitor to the BCD396XT), but all this after-talk is not.

From: Matthew Mummert
Topic: 8411 Message: 8419

The direct answer is NO however there is computer software that lets you decode stuff like ProVoice using two scanners linked to a computer running the software. I don't know much about it, just that it does exist.

This is assuming it's not encrypted of course.

I'd lie to hear more about how to use two scanners and a computer to hear unscrambled EDACS Pro Voice. I believe the City of Waterbury Ct. had a system that required this type of trunked tracking... And I think they have since done away with it with an APCO 25 system which is compatible with current trunking scanners. Can anyone elaborate on the 2 scanner/computer setup? Software programming available?

I have a new BCD396XT. The firmware is V1.11.01. I have installed
ARC XT PRO software, V1.9-Build 2 on Windows 7. I am trying to
get them to talk to each other. I am using the Uniden USB-1 cable.
I have installed the PL-2303 driver software and rebooted. Windows
recognizes the driver. The CheckChip tool tells me I have chip
PL2303HXD which is supposed to work on Windows 7 (and 8).
However the ARC software tells me it cannot detect my scanner.
I have tried baudrates of both 57,600 and 115,200.

Any suggestions?

Jim

I think I've seen this posted before. From what I recall, the SW author said it was an issue with the OS, and of course Microsoft was saying it was an issue with the program. This is all third hand info or greater.

Try another SW package and see if it works with that.

I had the same problem when I switched from XP to 7, although I am have a 396T using Uniden UASD software. What I had to do was connect the USB cable, connect the scanner, and make sure the scanner was turned on. I then went into Device Manager and determined which port Windows was assigning to the USB cable. I set the correct port in the software and, within 2 seconds, the scanner and software connected. I have had no further problems since. You might give that a try and see if it works for you.

Good Luck

Tim Matthews

The only problems I have had in the past were baud rate and COM Port. Make sure the COM Port assigned by Windows matches the COM Port set in ARC or vis-versa. If the rates and ports don't match, no communication.

"I have tried baud rates of both 57,600 and 115,200."

I can't connect sometimes just as you and my main problem is the I both the scanner and the program I'm using to program set at the same Baud Rate. This always create a problem as I use a GPS with my scanner on the road and always forget to set it back to 115,200 for programming because the GPS puck uses 4800 only. Give it a look at just maybe the scanner isn't set the same as the setting in the program, then just maybe if this is your problem also your scanner will be detected as well.

I use ARC-XT PRO and FreeScan on my Windows 7 computer.
No problems.

You have to use the correct driver for your connection from the computer to the radio.
Mine was a USB to Serial. I could not use the same driver that I used on Windows XP.
Once I downloaded the correct driver everything worked fine.

Go to www.radioreference.com and download the driver.

Thanks for all the suggestions, but no success so far. I double checked my port and baudrate settings, since there is a lot of room for mistakes there. Port must be set in 2 places (Windows Device Manager and ARC XT software). Baudrate must be set in 3 places (Windows Device Manager, ARC XT software, and scanner). Also ARC XT seems to like to change the baudrate default to 57,600.

I apparently have the latest driver for the chip in my USB-1 cable from Prolific itself.

Switching to FreeScan or other software is going to be a last ditch option, since I've already paid for the ARC XT software.

I have the Windows 8 upgrade DVD sitting on a shelf and have been meaning to do that. But I had hoped to get the scanner working before I dealt with a Windows version change.

Just for clarification, I'm not suggesting abandoning ARC. I suggested trying another program as a diagnostic tool. Right now, you have four things that are not talking to each other (scanner, cable, driver, and SW). You have to start eliminating one of those things to determine the problem, and I doubt you have another scanner or cable. You can try a different driver or different SW. The SW is the easiest to reverse (since you can simply not use it or delete it).

If you try different SW (note: TRY) and it works then you know the scanner, cable, and driver are GOOD and you can focus your time (and ours) on the SW as the source of the issue. If another SW package does not work, the problem is likely elsewhere.

Of course, if you have another scanner or cable, you can try switching those out. Only replace one element at a time so you can see what is causing the issue.

Actually the port setting has to be set in the scanner as well, so it is 3 places, check to make sure its right in the scanner too!

Jim specifically said he set it in all 3 places.

8437. Re: [BCD396XT] question

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-10-22 14:10:14 UTC
From: William Edwards
Topic: 8422 Message: 8437

Here is what solved the connection problem for me. The ARC software and programming cable wanted the same physical USB port to be used every time to connect to the radio, and wanted to call that port by the same number every time (e.g., "COM 4").

The whole setup became unhappy if I used that same physical USB port to, for example, plug in a camera to download pictures.

This would sometimes require a computer restart to flush out the assignment of that port to the camera and free it up for assignment to the scanner programming cable. If you re-booted into Safe Mode with minimal drivers I wonder if that would eliminate port conflicts and enable a test connection.

>I can't connect sometimes just as you and my main problem is the I both the scanner and the program I'm using to program set at the same Baud Rate. This always create a problem as I use a GPS with my scanner on the road and always forget to set it back to 115,200 for programming because the GPS puck uses 4800 only. Give it a look at just maybe the scanner isn't set the same as the setting in the program, then just maybe if this is your problem also your scanner will be detected as well.

Have been reading for a few days now, this topic. My question, and I really believe it is an honest one (please no crude remarks), why does this process have to be so complicated? You have to be a PC programmer to understand the lingo, and to just plug in a chord. I am glad I program my scanner completely using the keypad. I really feel your frustration and pain. Sorry if I stepped on toes.

Usually just plugging in the scanner isn't a big deal, however with some computers and some software it can be an issue.
As for why do some use software, I for one don't want to sit and put 14,000 freageuncies and TGID's in by hand. I have that much in a 396XT and 996XT. I can download what I want and be using it before you get 1000 programmed by hand.

But I do think everyone should know how to manually program all their scanners, and I always learn to hand program before using software.
It all comes down to personal choice though.

John, I haven’t figured out how to set the port in the scanner. Would you care to enlighten me? Actually I’m not sure why the scanner would need to know the port. It should be able to deal with whatever port the computer presented to it.

Jim

From: John Stark

Actually the port setting has to be set in the scanner as well, so it is 3 places, check to make sure its right in the scanner too!

Scott, yes absolutely I had the baud rates set the same. But thanks for the advice about switching between computer and GPS. When I get to trying GPS, I will keep that in mind.

Jimn

From: scott16148@...

"I have tried baud rates of both 57,600 and 115,200."

I totally understand this.... However do you have the scanner set at the same rate as the program is set to? This is where I have encountered my problems when I hook up to the computer with my handheld. I change the rate to use my GPS and when I get home to download the scanner on to the computer I forget to change it back to what I have FreeScan set to. I get the pop-up saying the it can't connect or find the Com Port. So I just switch back the scanner to the set rate I have the program set to all is good....

Scott

Also ARC XT seems to like to change the baudrate default to 57,600.

I apparently have the latest driver for the chip in my USB-1 cable from Prolific itself.

Switching to FreeScan or other software is going to be a last ditch option, since I’ve already paid for the ARC XT software.

I have the Windows 8 upgrade DVD sitting on a shelf and have been meaning to do that. But I had hoped to get the scanner working before I dealt with a Windows version change.

Jim

From: Jim Mehl

I have a new BCD396XT. The firmware is V1.11.01. I have installed ARC XT PRO software, V1.9-Build 2 on Windows 7. I am trying to get them to talk to each other. I am using the Uniden USB-1 cable. I have installed the PL-2303 driver software and rebooted. Windows recognizes the driver. The CheckChip tool tells me I have chip

PL2303HXD which is supposed to work on Windows 7 (and 8).
However the ARC software tells me it cannot detect my scanner.
I have tried baudrates of both 57,600 and 115,200.

Any suggestions?

Jim

Thanks Joe, that's an excellent approach. I have downloaded FreeSCAN and will see if it makes a difference.

Jim

-----Original Message-----
From: MCH

Just for clarification, I'm not suggesting abandoning ARC. I suggested trying another program as a diagnostic tool. Right now, you have four things that are not talking to each other (scanner, cable, driver, and SW). You have to start eliminating one of those things to determine the problem, and I doubt you have another scanner or cable. You can try a different driver or different SW. The SW is the easiest to reverse (since you can simply not use it or delete it).

If you try different SW (note: TRY) and it works then you know the scanner, cable, and driver are GOOD and you can focus your time (and ours) on the SW as the source of the issue. If another SW package does not work, the problem is likely elsewhere.

Of course, if you have another scanner or cable, you can try switching those out. Only replace one element at a time so you can see what is causing the issue.

Jeff, it depends on how you want the scanner to behave. I have multiple P-25 systems each having multiple talk groups, some of which I want to monitor and some I don't. It would take me hundreds of hours to get the programming the way I want it if I tried to do it by the keyboard. That's why I use software. Plus I have programmed over 200 scanners for this area.

I'm not saying my way is better than yours, it just works for me. Was with most things in life, it depends. :-)

Subject: Re: [BCD396XT] question

Have been reading for a few days now, this topic. My question, and I really believe it is an honest one (please no crude remarks), why does this process have to be so complicated? You have to be a PC programmer to understand the lingo, and to just plug in a chord. I am glad I program my scanner completely using the keypad. I really feel your frustration and pain. Sorry if I stepped on toes.
From: William Edwards <firemann57@...>

Subject: Re: [BCD396XT] question

Here is what solved the connection problem for me. The ARC software and programming cable wanted the same physical USB port to be used every time to connect to the radio, and wanted to call that port by the same number every time (e.g., "COM 4").

The whole setup became unhappy if I used that same physical USB port to, for example, plug in a camera to download pictures.
This would sometimes require a computer restart to flush out the assignment of that port to the camera and free it up for assignment to the scanner programming cable. If you re-booted into Safe Mode with minimal drivers I wonder if that would eliminate port conflicts and enable a test connection.

John,
When I do Menu->Settings->Set Serial Port, the only choices
I get are for baudrate. There is no option for choosing COM3,
COM4, or whatever. I still maintain that there should't be.

If I were in your position I'd start to think I got bad cable or something hardware related like a defective plug on the radio itself. If you know anyone else with that radio maybe you could try to plug their radio into your computer or swap cables just as a process of elimination. If the cable is recognized and the setting are correct, hardware is the only thing left.

Run it 24/7 365 on several systems. So what do you need to know?
And FYI there is s list for the program too.

In response to Jeffry Rehm: "why does this process have to be so complicated? You have to be a PC programmer to understand the lingo, and to just plug in a chord."

Actually, it's not difficult at all, compared to the Legacy days of assigning addresses, interrupts, and baud rates to every device that was connected to the computer. You could spend days getting everything working, and then if you connected something else you had to start all over again.

Uniden started making programmable scanners back in the days of serial ports on computers, there was no USB. You installed the software and set the comm port number according to which serial connector you connected your wire. You set the baud rate so that information was sent/received at the correct speed. Older computers were slower and required slower baud rates, newer computers were faster and could run faster baud rates. The faster the baud rate, the faster you can read/write to the scanner. The software was written using this port/baud rate convention.

Nowadays most computers don't even have serial ports, only USB. Uniden has elected, good or bad, to continue using the serial port conventions, maybe serial is cheaper/smaller/simpler, maybe just to keep everything compatible, The USB1 and other USB/serial adapters are available so that really is a moot point.

The problem arises with the drivers for the adapters. Someone could build an adapter, and write a driver, and the appropriate software, so that you could just install, plug, and go. You would need a driver for every OS that the adapter/software could run on, or limit your adapter/software to only one OS. Or you can build your adapter/software to run on multiple OSs and use the old serial conventions to assign port numbers and baud rates so that your users could continue to use serial connectors, or the generic (cheaper) adapters. I personally like the idea of a larger user base.

With "universal" USB/serial adapters you may need to connect everything and with the scanner turned on, and check your Device Manager to see which port Windows assigned to your adapter, and set the baud rate of the adapter. Then just set the port number and baud rate in your software, and set the baud rate in the scanner. Or you may get lucky and everything just work, it depends on the adapter and driver. If your computer is not detecting the USB adapter, then you have a problem with the adapter or driver, or the adapter may not work in the USB port that it is connected to. Some adapters will not work if connected to a USB 3 port (yeah, I know, it should work), you may need to use the USB 2 port. USB 3 is blue, USB 2 is black.

I elected to use the RT Systems USB to Serial adapter. USB on one end, serial port on the other end. One adapter, one driver, serial port to

connect all of my serial devices. Another advantage, most devices have the option of a serial cable for 5 bucks or a USB cable for 25 bucks, I can choose cheaper (and I can make a cable if I really need to).

Bottom line, life wouldn't be fun if there was only one way to do stuff, options make things interesting.

To Tim and Larry.

Great responses. I respect every aspect of programming scanners. By computer or by keypad. They are all part of our great hobby. I was just trying to note that there are many issues that get covered over and over regarding PC programming. There aren't any problems (apparently) that discuss programming via the keypad. I am cool with anything and everything you guys talk about. Go for it. I understand. It is just my choice to program via the keypad based on what I have read over the years. Yes 14,000 channels are a lot. I only have about 6,000. And having software to help can be very helpful.

Just noticing the length of Tim's defense of computer programming scanners scares me. In part that's why I asked why it seems to be so difficult.

I just hope our friend finds a solution to his problem. I hope he has hair left on his head.

Have a great week ahead guys.

Subject: RE: [BCD396XT] question

Jeff, it depends on how you want the scanner to behave. I have multiple P-25 systems each having multiple talk groups, some of which I want to monitor and some I don't. It would take me hundreds of hours to get the programming the way I want it if I tried to do it by the keyboard. That's why I use software. Plus I have programmed over 200 scanners for this area.

I'm not saying my way is better than yours, it just works for me. Was with most things in life, it depends. :-)

Have been reading for a few days now, this topic. My question, and I really believe it is an honest one (please no crude remarks), why does this process have to be so complicated? You have to be a PC programmer to understand the lingo, and to just plug in a chord. I am glad I program my scanner completely using the keypad. I really feel your frustration and pain. Sorry if I stepped on toes.

Subject: Re: [BCD396XT] question

Here is what solved the connection problem for me. The ARC software and programming cable wanted the same physical USB port to be used every time to connect to the radio, and wanted to call that port by the same number every time (e.g., "COM 4").
The whole setup became unhappy if I used that same physical USB port to, for example, plug in a camera to download pictures.
This would sometimes require a computer restart to flush out the assignment of that port to the camera and free it up for assignment to the scanner programming cable. If you re-booted into Safe Mode with minimal drivers I wonder if that would eliminate port conflicts and enable a test connection.

You are in the scanner, not the software. To scan for the port you go to "Scanner/Communication Setup" There you have the option to select the port or scan for it. The software has to know which port in order to make the connection. While most people may have just one port, some of us have several for various devices. The scanner, of course, knows nothing about a port, it is just an USB connection, but the software/cable connection converts the USB to a serial port.

MCH <mch@...> wrote:

Just for clarification, I'm not suggesting abandoning ARC. I suggested trying another program as a diagnostic tool. Right now, you have four things that are not talking to each other (scanner, cable, driver, and SW). You have to start eliminating one of those things to determine the problem, and I doubt you have another scanner or cable. You can try a different driver or different SW. The SW is the easiest to reverse (since you can simply not use it or delete it).

If you try different SW (note: TRY) and it works then you know the scanner, cable, and driver are GOOD and you can focus your time (and ours) on the SW as the source of the issue. If another SW package does not work, the problem is likely elsewhere.

Of course, if you have another scanner or cable, you can try switching those out. Only replace one element at a time so you can see what is causing the issue.

I had this problem, sort of. It would work great under Win7, but nothing under Win8. Butel suggested I use the 1.7 driver, rather than the 1.8 driver. It worked, BUT, I had to turn off automatic updates as it get updated an cease to work :) I did find that Freescan and Proscan worked great with the newer driver, so the OS is not the complete issue . I wanted to use Arc XT Pro as I was used to it and could put off learning other software til later , so I downgraded the driver for it to work. Go here to get the older driver: http://www.scannermaster.com/USB_Cable_p/01-551038.htm

Subject: [BCD396XT] question

I have a new BCD396XT. The firmware is V1.11.01. I have installed

ARC XT PRO software, V1.9-Build 2 on Windows 7. I am trying to

get them to talk to each other. I am using the Uniden USB-1 cable.

I have installed the PL-2303 driver software and rebooted. Windows

recognizes the driver. The CheckChip tool tells me I have chip

PL2303HXD which is supposed to work on Windows 7 (and 8).

However the ARC software tells me it cannot detect my scanner.

I have tried baudrates of both 57,600 and 115,200.

Any suggestions?

Jim

No, no, no, no,no,no, don't get me wrong, I'm not trying to defend programming via software over programming via keyboard. I was just trying to explain the computer - adapter - scanner configuration, and how/why that is the way that it is. I have no problem with someone programming via keyboard, and I think everybody should know how to do it (you never know when you might need to add something).

The reason programming a scanner these days is so difficult, again, blame technology advances. When I got my first scanner it had 8 channels that you bought crystals for, and I couldn't fill all 8 slots. The police department had 3 repeated dispatch channels and 1 simplex tac channel, and you had to be in the right part of the city to hear the different dispatch channels. The fire department had 1 dispatch and 2 simplex fireground channels.

Today, that same city has a trunked radio system, the police department has 9 primary dispatch talk groups, 9 secondary dispatch talk groups, tactical, detectives, SWAT, events, etc with over 100 talkgroups. The fire/rescue department has 68 talkgroups. The county has a 4 site trunked system that the county and all the other cities in the county use, with hundreds & hundreds of talkgroups, including INTEROPERABILITY groups that are used on a regular basis. We also have the state conventional systems. So you can see, programming can be a nightmare, and for me, programming via keyboard would be pure #3!!. Using software, I can visualize the setup as I program it, and if I want to change something it just takes a few minutes.

Today the systems are more complicated, which makes the scanners more complicated. But for us in the unencrypted part of the country, there is so much more to listen to than we used to have.

That's cool. I know the TG quandry. In my area i have two statewide systems to play with. But i don't mind. Punching the keys on my scanner keeps me occupied for quite a while resulting in less criminal time. Ha ha. Have a good weekend.

I'm also having a port problem, but not just with ARC396XT PRO. So I looked at device manager and discovered a yellow triangle with an explanation (!) in it. That told me I have a problem with my computer but haven't been able to correct it. The driver is up to date, running Windows 8.1. I noticed my problem AFTER I upgraded my Windows 8 to 8.1. So now I'm sitting back waiting for the problem to be identified and corrected by Microsoft (hopefully).

As far as assuring the radio is set to the right port is concerned... I see only the ability to change baud rate, not numbered port settings. Maybe I misread earlier posts. I did try using different ports. I also am suspicious of the computer telling me comm port 4 was the available port, when I'm used to seeing 3 or 5. But 3 and 5 are assigned. I forced the computer to use 3 and 5 to no avail.

Success! At Joe M's suggestion, I tried some other software (FreeSCAN). That worked which pretty much eliminated the cable or the scanner as problems. At JohnW's suggestion, I looked at the driver I had installed. It was 1.7. Just to make sure I re-installed it. Arc XT Pro now recognized the scanner. My guess is that something went wrong with my original driver installation.

Anyway, thanks to all for suggestions. Now I can move on to other things (like GPS).

Jim

From: mailto:beauregardw@...

I had this problem, sort of. It would work great under Win7, but nothing under Win8. Butel suggested I use the 1.7 driver, rather than the 1.8 driver. It worked, BUT, I had to turn off automatic updates as it get updated an cease to work :) I did find that Freescan and Proscan worked great with the newer driver, so the OS is not the complete issue . I wanted to use Arc XT Pro as I was used to it and could put off learning other software til later , so I downgraded the driver for it to work. Go here to get the older driver: http://www.scannermaster.com/USB_Cable_p/01-551038.htm

What device are you using?
USB-1?
USB-Serial adapter?
If the latter, what make/model?

Hi All
please advise how can i import ICF file(ICOM clone program) to Freescan (Uniden).
my IC-R20 collect channels and i want to use the ICF file it made to be use with my BCD396 and the Freescan program.
Thanks
R

Can you read the IC-R20 with its own program? If so, copy
the data there, then use EZ-Grab to paste it into FreeScan.

If you can export to CSV, then read into FreeScan, that may work, too.

Usually, programs from different
manufacturers are not compatible at all.

Yes, that was strange. I can only assume that the driver
installation problem was minor enough that it affected
only ARC and not FreeScan.

Jim

I thought Microsoft pulled the 8.1 updates off because of some problems. My first thought would be to go back to Windows 8. I hope this helps. I still use XP with SP 3 so I'm only guessing.

There is a known bug between the latest drivers and Arc Xt and Win8. Freescan, Proscan, et al, work just fine, just not ARcXt, it needs the older driver. Butel says that is it an OS issue, not software. BUT since other programs work, then it has to be an issue with Win8 that he does quite grasp..

I fixed my issue by installing an older driver. I guess the Windows 8.1 upgrade came with newer drivers. So when I right clicked on the USB port in Device Manager it offered to roll back to a previous driver or look for a different on on my computer or online. I looked on my computer and found an older driver so I tried it. It worked!

I wonder if someone is looking at that-the people who produce that USB programming and the drivers for the USB ports... Or is it the responsibility of (Butel for example) to provide updated software that conforms to the latest USB drivers?

It's up to the hardware manufacturers to keep their drivers up to date. Sometimes someone else will come out with a generic driver, but if the OS is updated, the driver can fail again.

In this case problem is ONLY with Butel software, Freescan, Proscan, et al, worked fine with the new drivers. My guess is that there is a switch, library or some such that Butel is not aware of and either the others are aware, or their code does not use it. How else would 3 out of 4 programs work with the new drivers, and only one does not. Butel says it is a OS issue, and he is probably right as it works/worked just fine on my Win7 systems, but, 1 out of 4??

An observation, there has been a few questions about port numbers. In the case of Arc XT, at least, the software determines the port number, not the driver, which as it is a software simulation makes some sense. I was plugged into port 4 and I moved to another usb port that was closer to my scanner so my cables would not be stretched all over. The link would not work. I went to 'Scanner/Communication Setup' the port was 4. I clicked the 'AutoDetect Scanner' button. It went through its paces, and found my scanner. The port was now 10. Since I did not touch the driver, the software set the port, and things are working fine now, just not quite a tangle of cords :)

BTW as I was messing with software earlier while my ARC XT was not working, I discovered something that I had been wanting on scanners for years. You all probably know all about it. It is the display light. I always wondered why the light could not be kept on while plugged in. Obviously, when you are on battery power you do not want it on all the time. But, when it is plugged in, it would be nice to have it on so I could read the display. Well, I found that I had the option with this scanner - sort of. I found I could set it so that when I turned the light on, it would stay until I turned it off. The 'Light' button basically becomes an Off/On switch. You can turn it on when you want it, and turn it off when you are done. Very nice. Granted with the computer readouts it is not as important as it used to be, but still, it is nice.

JohnW,

You can also turn the light on manually as well with the keypad, use the on/off/light key.

>BTW as I was messing with software earlier while my ARC XT was not working, I discovered something that I had been wanting on scanners for years. You all probably know all about it. It is the display light. I always wondered why the light could not be kept on while plugged in. Obviously, when you are on battery power you do not want it on all the time. But, when it is plugged in, it would be nice to have it on so I could read the display. Well, I found that I had the option with this scanner – sort of. I found I could set it so that when I turned the light on, it would stay until I turned it off. The ‘Light’ button basically becomes an Off/On switch. You can turn it on when you want it, and turn it off when you are done. Very nice… Granted with the computer readouts it is not as important as it used to be, but still, it is nice.

Hi Ronen;

http://unitrunker.com/uniden_xt.html

Some information that may help.

On Wednesday, October 23, 2013 9:01 AM, Dubir <dubir@...> wrote:

Dear Johan
I can't connect the scanner (bcd396) can you please give me some tips to so it?
I live in a country that you need to collect by yourself
the groups and channels.
Thanks
Ronen

if a user can load another brand of software and it works for everyone, and 1 out of 4 can't use this software, there is an issue with the software. It's always easier to blame it on some other software than to fix what they sold you.

Oh that it were that simple ! With so many Independent variables involved, it's amazing how well Operating Systems, Hardware, Peripheral devices and Application Software together. Seems to me , with all the different Elements evolving as they do, the different parties involved must have a very difficult job ensuring compatability with each other's revisions. This inevitably must lead to some debate as to who is "Out of Step" at any time. In the end I guess it's a business decision what the appropriate supplier of OS, Hardware or whatever element does about each case. Not always easy. The Marketplace always wins buy voting with their dollars.

It may have sounded confused, but that was what I was referring to, that and the software button as well. It came in handy the other day. We had a power failure for a couple of hours and I was able to follow the whole deal with my radio. Having the light on while listening was nice. Someone had hit a power pole knocking the power line down across the freeway. It knocked out power for about 5,000 to 10,000 (including us), but it shut down the freeway for several hours. This was particularly bad as it was one of the two north-south freeways in California.

John,

I believe I must have had a different problem as the USB ports did not work with anything. But, since using a previous driver fixed my problem, namely, restoring the ports, I can assume that while my problem was a different one, affecting all USB ports and anything I plugged into them, the correction was the same, using a different driver.

Do you need to have the batteries and plugged in at the same time. When I try to just use the power supply that came with the scanner it says illegal voltage on the screen when I use rechargeable batteries it uses 3 a day. Any info appreciated.

You should be able to run just off the supply. Try plugging it
in and turning the scanner on then removing one of the cells. I
suspect the non-load voltage is higher than the scanner wants to see.

Absolutely, without the batteries, the voltage from the power supply can float much higher then spec.
depending on the power supply quality, it may be too high and could possibly be harmful..

my 2¢ always keep the batteries in the circuit

Took the batteries out, plugged into wall with the power supply and nothing. All it says is illegal voltage.

No when the batteries are in it works fine but when the batteries die and it is plugged in the message comes on the screen. I tried having it plugged in and take one of the batteries out and it dies right away and the message appears on the screen again.

From: Uniden UPMan
Topic: 8483 Message: 8490

How long do one set of batteries last?

If the batteries go dead quickly, then I'd suspect a fault in the scanner's power circuit. If the batteries last a normal duration (6-8 hours), then I'd suspect a fault with the AC adapter.

What position is the charge switch set for? Are you using the Uniden adapter or an after-market?

Using the adapter that came with the scanner. Doesn't make any sense why you should have to use batteries and the battery supply at the same time and it uses the batteries at the same time.

8493. BCD 396XT Repair Experience

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-10-29 19:37:00 UTC
From: Robert Arenella
Topic: 8483 Message: 8493

Sent in my 396XT for repair on 9/26. Uniden received it on 10/1.
It had a broken sleeve on the SMA connector. I've got 24 handi talkies
and scanners, but this is the first SMA connector I've broken.

In my letter that went with the scanner, I asked that the front
case half and display window also be replaced. It showed some use but
was completely servicable. I also asked that the old case and display
window be returned to me. Got it back today and all is fine with the
scanner.......but the old case was not returned.

I talked with someone at Uniden....and they told me they don't
return old parts. So I guess they took a servicable front case and
tossed it in the garbage, rather than returning it to me. I picked up a
396XT at a Ham Fest 2 weeks ago with a trashed front case on it for
cheap. I figured, great, I'll put my old case on this one and make it
pretty......NOT. I can understand not returning proprietary
electronics, but a piece of plastic?????

I've got 2 396XT's, 2 396T's, an HP-1, a 996T, a 996XT and an RH96.
Why would uniden want to piss off a customer....especially one who buys
lots of their products???

Bob A.

It may simply be their policy to recycle the old parts.

I understand your point, but the tech may not have had a choice.

If it was repaired under warranty, I can understand why they don't return old parts.

If you paid for the full repair service and new parts, then I can understand your concern.

It had a broken sleeve on the SMA connector. I've got 24 handi talkies
and scanners, but this is the first SMA connector I've broken.

In my letter that went with the scanner, I asked that the front
case half and display window also be replaced. It showed some use but
was completely servicable. I also asked that the old case and display
window be returned to me. Got it back today and all is fine with the
scanner.......but the old case was not returned.

I talked with someone at Uniden....and they told me they don't
return old parts. So I guess they took a servicable front case and
tossed it in the garbage, rather than returning it to me. I picked up a
396XT at a Ham Fest 2 weeks ago with a trashed front case on it for
cheap. I figured, great, I'll put my old case on this one and make it
pretty......NOT. I can understand not returning proprietary
electronics, but a piece of plastic?????

I've got 2 396XT's, 2 396T's, an HP-1, a 996T, a 996XT and an RH96.
Why would uniden want to piss off a customer....especially one who buys
lots of their products???

Bob A.

I don't get it when I use the original charger. however, I do get it trying
to use a after market adapter.
do you have the scanner set to charge the rechargeables or is it set for
alkaline non rechargeable batteries?
when set to alkaline I get charge off with the original.
if you get anything else your adapter is more than likely faulty.
I get what you mean it eats batteries like they are going out of stile mine
too...I have been wanting to get a car adapter but since I have a power
inverter already I just use it on long trips.

Turn it off before plugging it in. My grecom 500 does the same thing if have it on then plug it in.

Thanks

From: williamhutton47
Topic: 8498 Message: 8498

Hello everyone,
Thanks for all the great tips and advice I get off these pages, big help, many times. I guess I woke up one morning and thought I'd get into the radio hobby, but I didn't realize there was so much info about a scanner out there. I have read everything I can find and still don't really understand. I get the concept, but what I don't get is how the TGIDs work. I've found very little literature on it, and radio reference is a big help, but I just keep getting parts of transmissions and when the scanner hits and the TGID displays with the freq, etc. I don't hear anything. I'm programming by hand and messing up somewhere?? Any literature referals or video tutorials for the bcd396xt would be a huge help. computers and I don't get along well, and this ones a dinosaur so I cant hook the cable that came with the scanner to it. Thx

I have a 396XT and a 396T. The 396T is powered by the wall wart that came with the radio without batteries. No problem. Since I have not tried it with the XT (I will tonight) I don't know for sure if I can duplicate your experience with the XT. Make sure you are using the wall wart that came with the radio. If you still get the same warning, I wouldn't continue attempting it-you said the radio won't play anyways so leave the batteries in. Trouble with that is the built-in charger will continue charging after the batteries have charged and they will get hot. Heat is a battery's enemy and will shorten its life, not to mention that heat could also cook the radio and cause a component "dry-out". I use an aftermarket charger for my rechargables which monitors the charge rate, reducing to trickle so the batteries never get hot. I try to follow the rule "ALWAYS remove the batteries from the radio and charge them using a good quality charging system. They have a longer cycle life, getting closer to the 1000 charge cycles I like to call optimum. But there is also that concern mentioned in one of the answers posted here that suggest there may be something wrong with your XT. What does UNIDEN have to say about your issue?

Bill

Well... With 24 handies the odds are it had to happen sometime! :)

Seriously, I've ordered parts such as new fronts, keypads, etc. and swapped them out myself. I found I ended up throwing the old parts out after I got over my horde obsession. It's nicer to use the pretty new stuff anyway. As far as doing the work myself, my reason is parts arrive sooner than if I sent the radio in for work. Their repair cost is very reasonable, but their turnaround rate, not so much...

Hopefully you can find someone local who can computer program your radio. Check with the local FD for a fire buff or member who is well versed in this. That programming software is designed to eliminate the need to understand how a trunked system uses talk groups and manually program. For the guy who just wants the radio to perform as advertised without the needed learning curve.

8502. Trouble with Freescan programming quick keys on sites

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-10-30 10:45:47 UTC
From: <gelliott2929@...>
Topic: 8502 Message: 8502

Hi I am in need of help. I am using Freescan and a BCD396XT. I have assigned quick keys to my conventional systems. Works great to disable for scanning. I cannot get a QK assigned to Digital sites. When I try in Freescan the box says "by site" I click and pick the next # and it says dong so will effect all other sites. I click OK and nothing is assigned. HELP? I need to disable the digital sites for scanning.

For trunked radio systems, SQKs are assigned at the "SITE" level, not the System level.

I'm sorry if I missed your reply, but I cannot find that you ever answered my question:

How long does a set of batteries last in the scanner?

Note that some bad information has been promoted in this thread:

1) You do not need to have batteries installed when the adapter is in use.
2) The voltage of the adapter will not "float up" if batteries are not installed.
3) It doesn't matter what position the switch in the battery compartment is in.

Thanks. That was my first instinct, but I'm not one to be easily stumped, so now it's kind of a battle between good and evil, and it's actually pretty fun and interesting.(along with frusterating as well) I will have uit programmed by a computer asap, and for now it gives me something to learn about. I'm just missing so much, but I'll get there. Thanks for the help everyone

yeah, that would be great I have had several radio's in the past couple of decades and this is the only one that just takes 3 batteries and is dead in almost a half of a day. Oh and another thing I have it set to battery saver as well.
yes, I purchased from r/s new in the box almost a year ago......

guess I can't change things now if I don't want it I could give it away seems that is the going price these days.

8510. Re: [BCD396XT] RE: power supply

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-10-30 23:59:20 UTC
From: John Stark
Topic: 8483 Message: 8510

Keep in mind the following will drain the batteries quicker:
Backlight ....biggest drain!
Volume level affects drain
Amount of radio traffic
If I need more listening time I have a file that doesn't use any backlight or alert lighting. That and using an earphone helps keep the audio level down and limit the systems I listen too as well. If I push it I have gotten 14 hours out of a charge.

John

Depends on:

* How much activity you are hearing
* Volume level
* capacity of cells
* backlight status

From: MCH
Topic: 8483 Message: 8512

Didn't see this post until after I made mine (which says the same thing).

You forgot cell capacity, John. :-)

If you really want to save your battery, use a BlueTooth adapter and an amplified speaker mic. That keeps the scanner drain low while giving more audio than the scanner can provide.

Joe M.

Topic: 8483 Message: 8513

Actually I didn't forget cell capacity as I went by the standard cells that come with the radio.
John

8514. Re: [BCD396XT] RE: power supply

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-10-31 01:47:58 UTC
From: Jim Mehl
Topic: 8483 Message: 8514

Could you provide more information on a BlueTooth adapter that would work? I assume it would have to be one that would connect to a serial port. I have not seen any of those. On the other hand an amplified speaker that will pick up BlueTooth should not be a problem.

Jim

From: MCH

Didn't see this post until after I made mine (which says the same thing).

You forgot cell capacity, John. :-)

If you really want to save your battery, use a BlueTooth adapter and an amplified speaker mic. That keeps the scanner drain low while giving more audio than the scanner can provide.

Joe M.

8515. Bluetooth adapters (was: Re: [BCD396XT] RE: power supply)

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-10-31 01:52:57 UTC
From: MCH
Topic: 8483 Message: 8515

I use the Jabra A120S, but you can search ebay for "bluetooth adapter"
and find a lot of them. You want one with a 3.5mm (3/32") stereo
connector (or any connector with the appropriate adapter).

Joe M.

BC396XT battery life on a single charge...

I try to use high capacity NiCads (2600 or 2700 mAh). I find they will give me 4 to 6 hours. I have the backlight set to come on for the shortest duration-I believe its 10 seconds when a transmission is heard and the volume is almost maxed out for half the time and set at half volume the rest. The amount of traffic is not by any means busy, but I do listen to 3 or 4 trunked systems and a conventional county listing of only FD's. I imagine if I listened to the PD's, which I have locked out my battery life would decrease. As for the battery saver option... I understand that it is not saving battery life while the radio is scanning. I have turned it on but am hardly ever parked on one frequency (where it's supposed to make a difference). But when I do "hold" the radio, and not scan, I expect I am allowing the saver setting to function, increasing the life slightly.

I like to attend military air shows and capture comms (sequestration killed the shows this year) and splurge on a bunch of lithium-ion disposables for the occasions. They aren't cheap but really last a long time. When considering I have programmed the radio to capture every imaginable comm at the show, the radio is always pumping out audio-putting a sizable drain on the cells. I use a headset which keeps the volume set low and I can get a good 8 hours out of a set.

Bill

I have the light come on with every most transmissions. I usually reserve it for unusual ones.. fire(red) ems (blue) and Highway Patrol (blue) . I turn it on at 8am and it runs all day till 6pm at which time it usually starts to beep a warning between 5 and 6.

I have 2 La Crosse chargers and 12 Sanyo eneloop 2400 ma that I cycled in groups of 3. I use a sharpie of different colors to circle the base to keep the same three together. I cycle the 2 goups of 6 alternating between the 2.

Why? I don't trust chargers. I especially don't trust non intelligent chargers. This is a small price to pay when the scanner costs so much. I also trust Uniden but not Uniden service or folks but their infrastructure. I don't want the scanner to fail and that seems to be the only weak link, other than absurdly hard to intuitively program. (Small plug for the cheat sheet ($10) from Scannerworld. I have to carry it with me but well well well worth the 10 bucks (shipping and actual cost). Don't bother to buy however unless you have bled over the actual manual. It just serves as a geat mental tickler.

Cheers...

From: <raruzicka@...>
Topic: 8518 Message: 8518

suddenly i am now getting charge off. my batteries are correct as is the switch in the batter case. odd how it started. i had the freescan lcars virtual display controlling the scanner. i clicked on the power off. it did not power off, but from that point in time now i only get charge off. next time i had the display up and hit power off, it powered off correctly. is it possible for the software to change some setting in scanner config that nulllifies the switch setting? think a factory restore would help, and if so, how does one do it? could not find it in user manual.

i charge batteries outside radio, but curious if anyone had any insights.

8519. Analog/Digital System

Rural area using analog system with capability to switch to digital on same frequency. Can't get the 396XT to receive the digital transmission. Have programmed the same frequency with both and only heard analog, then programmed the same frequency one as analog and another as digital. Any ideas why digital is not being received.

It could be encrypted, NXDG, Pro-voice, TRBO, X2. or several others I can't think of off the top of my head.

Most likely it is NOT digital at all but instead it is SPEECH INVERSION and your confusing that with digital. The odds of a system having both analog and digital on the same channel are pretty slim, especially in a rural area.

Topic: 8519 Message: 8528

In CT one of the small towns uses encrypted P25 dispatch, cars and portables are analog, same for several Hartford area gov't freqs.

Most likely it is NOT digital at all but instead it is SPEECH INVERSION and your confusing that with digital. The odds of a system having both analog and digital on the same channel are pretty slim, especially in a rural area.

**** I am in a little town in CT that does just that! PD recently
upgraded to P25, while dispatch, EMT & Fire are still all analog.

I am new to this group & this scanner!
I'm reading many posts & trying to learn as I go along.
I'm sure I will have many questions, and hope I don't annoy everyone by
asking simple/obvious things! LOL

Our fire service here is in the process of upgrading its dispatch channels to trunked P25 (unencrypted) statewide, while fireground channels will remain FM (mostly simplex). Still waiting on the technical details for the trunked network to come through (complicated by bureaucracy and non technical people in the chain!) , but I figure I'll set it up as a separate system, since I already have the conventional frequencies in the scanner as a system, and it's probably easier and less confusing to do it that way.

8533. Stubby antenna for 800 MHz

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-11-03 22:14:21 UTC
From: <n.one.one@...>
Topic: 8533 Message: 8533

I'm a new 396XT owner, stumbled through programming, and am getting local agencies loud and clear with the standard included antenna. Since the reception is so good I see no need for a long 800 MHz antenna.

Given the strong signal can I get by with a stubby?
Any recommendations on which one?
Thanks

8534. Re: [BCD396XT] Stubby antenna for 800 MHz

I usually use a stubby antenna on my XT. I've tried anything from the "Miracle Baby" antenna to a Racing Antenna sold at Radio Shack to a simple ethernet termination load. They all work about the same, and like your case, the signals of interest are strong enough to not need even the stock antenna. The stubby antennas make a good combination with the XT. The only downside is that you have to use the adapter if you use a stubby BNC antenna. But even that added it makes a nice stealthy combination.

Of course, monitoring Low Band is a total write-off using the super-small antennas. Even the stock antennas don't perform well there.

Thanks for the information. You gave me the confidence to buy a very short (1.75") Diamond SRH-805 2M/440/1.2 Tri-Band HT. It seems to work just fine with the strong signals in my area. I really like the fact that it's SMA so it looks great on the 396XT.

I went to Ham Radio Outlet in Atlanta and they let me do an A vs. B comparison with a slightly longer Diamond that is very bendable rubber. Even though it was longer it didn't seem to do as well. Sorry but I don't know that model number.

Before the Uniden unit was released, I used Byonics pucks, and Deluo pucks before that. Those, as well as the Uniden unit, work fine.

One advantage of the Uniden puck is that it is supported by Uniden. (no pointing finders back and forth in case there is a GPS/Scanner issue.)

From: Val P
Topic: 8540 Message: 8540

Hi All, im new to this group, and new to the BCD396XT.
Interesting radio,
I was wondering if anyone has a file, that I could look at in say Freescan, hopefully of the NSW RFS frequencies..
I wish to study it and hopefully get to understand this radio, but also so I can monitor RFS as I travel about the state for work. I am an active member of the RFS in my local area as well.
Thank for any replies that come my way Val

Hi Val. I used to have all the RFS talk groups loaded in, but had to cull a lot of them as I exceeded the maximum number of talk groups for the radio, and my primary listening is railways.
You'll need to set up two systems. One will be the NSWGRN which involves putting all the control frequencies in, followed by all the RFS talk groups which interest you (google NSWGRN for control frequencies and talk groups)
The second system will be analogue for all the simplex communications on the front line and the older communications.

Makes sense, but meantime I have to monitor my local PD on an online Feed, not the best way to be in on the action. I just missed one yesterday no antenna, no belt clip, chewed up usb cable by a Parrot, yes I did say Parrot and hard to find Coax adapter went for $240 got outbid by a lousy penny! Ive been seeing them going used for around $250-300 is that a good price?
Thanks

That's not a bad price at all for an XT.

And some of the larger Parrots can chew up a 2x4 easily,
so there may not have been much left of the cable. I'm
sure they could do a job on a scanner, too.

Thats a good price

And some parrots can take your finger off so chewing a cable isn't too difficult for them. A friends parrot (one of 4 she had) used yo sit with me and eat a slice of pizza.

From: <briewood@...>
Topic: 8540 Message: 8553

Thank you OB... logged in, communications, and looked at a few of the PDF files... Am interested in putting that into Freescan and uploading into the radio.

David Johnson, understand what your suggesting, will look into all of this tonight, just trying to get my head around the structure, remember, im new to scanners.... hence was hoping to get a small file of actual freq so i could study it.. THANK YOU for your messages all .-)

Val

Have a look within Operations section on MyRFS

On 14 Nov 2013, at 05:55, Val P <briewood@... mailto:briewood@...> wrote:

Hi All, im new to this group, and new to the BCD396XT.
Interesting radio,
I was wondering if anyone has a file, that I could look at in say Freescan, hopefully of the NSW RFS frequencies..
I wish to study it and hopefully get to understand this radio, but also so I can monitor RFS as I travel about the state for work. I am an active member of the RFS in my local area as well.
Thank for any replies that come my way Val

I can think of about 1000 reasons. Page refreshes span an instance of perl that generates the HTML that is sent to your web viewer. Right now, about 40 people are waiting for the page to be displayed...so that means that there are 40 instances of perl running. After about 20 instances, the CPUs are railed at 100%...

Once things calm down, response time will improve. Meanwhile, if you are waiting for the page do not refresh! It will respawn yet another instance of perl and put you back at the back of the line to get the page served out to you.

Wow, no wonder your wiki is usually slow! This is a sub-optimal way to run a webserver. Using something like mod_perl will keep you have having to start an external interpreter on every page view.

When you expect heavy load, like today, you can cache your perl output. There's no need to regenerate the content on every page load. Many CMS and wiki software can even auto-detect high loads and fallback to a static-only mode. There are CDN services that can cache content for you in globally distributed data centers. Cloud Flare is an easy one to implement, and they have a free plan if you don't need SSL:
https://www.cloudflare.com/plans

Tom

8567. Re: [BCD396XT] ALERT: 1 Hour till the Uniden America to launch newest flagship scanners event

Topic: 8557 Message: 8567

The hardware is very fast, so the window during which things slowed down was pretty small (about an hour, maybe less).

The multiple perl instances is just how TWiki does it...moving all the content to another platform or doing special setups for page caching isn't really worth it for the relatively short time the problem exists.

The irony of that is that there is no analog cellular in the US, and
none of the digital formats can be monitored by a scanner anyway so the
law no longer serves any purpose...

Agreed. The law is useless now. That is the danger of enacting or allowing to be enacted ANY law. The chances of said law ever being repealed are slim to none even if the law is outdated, stupid, useless, or never enforced. In this case it is all of the above yet rigorously enforced.

Mike

8572. Edacs/LTR LCN Tracker?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-11-18 20:36:10 UTC
From: <erlv2@...>
Topic: 8572 Message: 8572

I Noticed under the description for the new BCD436HP, that it has Edacs/LTR LCN Tracking, but when you read in the owners manual for any type of LCN activity, there isn't any listing for that Tracking mode. I wonder if UPMan can address this, is there a LCN finder in the program with this new radio?

It specifies 7.60 kHz TDMA which is not P25, so it most likely is OS.
(I don't remember the emission BW for OS offhand)

It also does analog (11.2 kHz) which would make it compatible with other
manufacturers.

Funny but the 800 MHz mobile does not specify that it does 700 MHz!

Momentum radios are tetra knock off's and are NOT open sky period. These
are not NEW as you people think they are. Harris has had them advertised
for 6 months now or longer.

Figures Harris would promote yet another proprietary trunking format.

These radios do trunking and conventional. The only problem is they are not available in the 800 mhz range which would limit the use of them by a lot of public safety agencies.

Check again. These radios have been advertised on the harris site as trunking radios, not DMR radios. Like i said, these radios are not new and have been on the public safety page for about 6 months now.

The Harris Momentum radios are rebadged Hytera units that operate DMR under the same Eurpoean protocol that Motorola modified to create their MotoTrbo line.

It also does analog (11.2 kHz) which would make it compatible with other manufacturers.

Funny but the 800 MHz mobile does not specify that it does 700 MHz!

Your correct, none of these radios have 700Mhz. That seems pretty short sighted considering the number of systems using that spectrum. It also could mean an inability to be used quickly without patching for mutual aid.

That makes sense, as 7.60 kHz is the DMR spec.
(I checked after my last post)

But, they are not likely compatible with trunked MotoTRBO trunking since MotoTRBO does not use the DMR Trunking standard, but a proprietary Motorola standard. They would be compatible with conventional MotoTRBO, but that's all (just like Hytera and all the other DMR radios).

The original link specified 800 MHz in the
mobile (didn't check the portable specs).

But, if it's DMR, there are no business bands on 700 MHz, and DMR is
designed for business users, not PS users. So, that would explain it.

According to the tech he works only on public safety radio systems using DMR! Harris's own site for these radios claims they will have 250,000 public safety users by 2015. So that dose not explain the lack of 700Mhz. The mobile and a couple portables both have 800Mhz. Interesting to say the least

Hello,
I watched the video and paused it and wrote down the reference URL for the new scanner but evidently wrote it down incorrectly.

Here is what I thought was the site for more information....

http://info.uniden.com/newscanners It fails to link correctly. Perhaps there was a date requirement but I thought it said info was there now.

Also... is there a user group anywhere for the BCD436HP?
Somewhere there was a link for the manual... but I am just now
getting back around to looking for it?

You should ask this on the 436 list, but try this URL:
<<http://info.uniden.com/Newscanners>>

(note the capital N)

Topic: 8573 Message: 8592

Apparently Harris is counting on the fact that other manufacturer's DMR equipment is not Public Safety rated or targeted and they feel that will give them a competitive edge. I know many PS agencies purchased business radios because they could get them cheaper than PS rated equipment. Whenever issues came up with Motorola, they were "informed" that the radio failed because it was not used in the service in which it was intended. I for one would not market DMR to PS when they know they can get Hytera radios for much lower cost that will "work on the same system".

Maybe OS is hurting Harris more than I've heard
if they have to resort to those kinds of tricks.

They claim the radios are made to mil spec for moisture too, another trick to sell to PS. I remember my old FD in PA bought cheap low power Chinese radios for the fire police. Those were horrible radios! And you didn't want yo get it wet either!

I searched for a 436 group on yahoo using several different criteria's and couldn't find one. Since you are be so gracious in wanting to point people in that direction could you please provide the link for that group.

Thank you in advance

From: <robert.glover@...>
Topic: 8597 Message: 8597

New BCD396XT

Received as a gift and never Used. Just charged the Batteries. Changed jobs and have never had a chance to load a single frequency. I need to find it a good home as it is not fair to just have it sit around being lonely. In addition to the original box, packaging and everything that came in it I will also include the USB-1 Cable, Car Charger, Bu Tel software, Leather Case. Paid $594.98 for everything. Make me a fair offer and it’s yours.

Yea - the new Yahoo neo must have been designed by someone who
wanted to be fired. I can't tell you how many bugs it has.

When I went to create some new groups, I had to use the Canadian site
since the USA (neo) site wouldn't process the submission. I know of
someone else who started a group only to have neo tell them the group
name was in use, but if you go directly to that page it says the group
was not found.

I still can't UL pics, and I'm not sure about files.

But, for those interested:
<<http://groups.yahoo.com/group/BCD436HP/>>
<<http://groups.yahoo.com/group/BCD536HP/>>

8602. Re: [BCD396XT] http:// ????? for the new 436

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-11-27 02:42:36 UTC
From: Brad
Topic: 8588 Message: 8602

Yep, it's now searchable but still won't complete a join group request. I've tried on 3 computers with 3 different browsers.

Thank you Yahoot

8604. Re: [BCD396XT] http:// ????? for the new 436

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-11-27 04:00:44 UTC
From: Jim Mehl
Topic: 8588 Message: 8604

That is the current preferred method for any yahoo group.
As Joe mentioned in a previous message, the new ‘neo’
system is a disaster.

Jim

That worked.
Thanks!

8606. New guy with a new BCD396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-11-27 16:10:57 UTC
From: jon a
Topic: 8606 Message: 8606

I picked up a new BCD396XT last week and so far am finding it to be a nice piece of equipment. I am using Freescan and RadioReference to do my programming. However, it has a behavior that is really annoying and makes the scanner almost useless, and I can't figure it out.

When I load in pre-programmed content via RadioReference/Freescan, the scanner accepts the content, and I can scan away. However, if the scanner stops on any frequency due to traffic, it will stay on that frequency only about 4 seconds before it starts scanning again. This is even if the transmissions are longer than 4 seconds. If I wipe the scanner and program it by hand (let's say the local NOAA WX channel or airport ATIS) it will scan and stop forever since those tranmissions are continuous.

I know about the -hold function (hold for only a preprogammed length of time no matter the channel activity) but that's not activated. The RR / Freescan combination appears to be introducing something that causes this to happen.

Any constructive suggestions?

Cheers - Jon N7UV

Check to make sure you don't have the DELAY time set negative. That's the function you were describing, but called HOLD time so I'm not sure if that is what you were talking about or not. For the HOLD time, set those to 0 would be my recommendation. The HOLD time has to be set for something - it cannot be disabled.

Also make sure DATA SKIP is not enabled.

MCH <mch@...> wrote:

Apparently Harris is counting on the fact that other manufacturer's DMR
equipment is not Public Safety rated or targeted and they feel that will
give them a competitive edge. I know many PS agencies purchased business
radios because they could get them cheaper than PS rated equipment.
Whenever issues came up with Motorola, they were "informed" that the
radio failed because it was not used in the service in which it was
intended. I for one would not market DMR to PS when they know they can
get Hytera radios for much lower cost that will "work on the same system".

Maybe OS is hurting Harris more than I've heard
if they have to resort to those kinds of tricks.

But the radios in question are DMR, not Open Sky.

Still, the answer is the same - no scanner can decode it.

8615. BCD996XT for sale - new in box...

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-12-09 23:49:17 UTC
From: Michael Lynch
Topic: 8615 Message: 8615

Hi,

This is the sister desktop/mobile unit to the Uniden BCD396XT handheld. The Uniden BCD996XT digital trunking police scanner. New in box. Due to selling my home and moving to another state, I never unpacked it or turned it on. Purchased last year for $470. I also have the Nifty mini quick reference manual for the unit (a $26 value). Asking $375 OBO. Perhaps some BCD396XT fans would like a desktop model, too. Contact Mike at lynchmf1@.... I am in the Phoenix, AZ area. Thanks!

8618. Illegal Voltage?

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-12-11 02:11:35 UTC
From: kwicker
Topic: 8618 Message: 8618

I get a message on the display that says Illegal Voltage when I plug in the car DC power supply that came with the scanner to the 396. The unit will not operate as long as the message is there. I tested the voltage on the connector and got 7.04 VDC with the tip positive. I have an older Radio Shack mobile DC power plug that will operate the 396 without the error message. It measures 6.94 VDC with the tip positive. The AC/DC power supply that came with the 396 measures 7.01 VDC with the tip positive. The display on the 396 indicates 4.01 to 4.03 volts with the two supplies that work. I'd like to use the power plug that came with the scanner. It's smaller, is fused, and has a red indicator light. What's up with the Illegal Voltage message? Thanks in advance for all input.

Sounds like your adapter went slightly out of tolerance for voltage.

It is probably not putting out the proper voltage under load. Putting a meter on it with no load it may appear to be within spec but once you load it, it drops out of spec and can't supply proper voltage and current.

The reason I didn't expect the current load is that with the scanner turned off, when I insert the DC power plug, the message "Illegal Voltage" comes up on the blank screen.

I am looking for a some BCD396XT battery covers. If your radio is not functioning and won't be repaired, I wonder if you would donate the battery cover to my project. It is my intent to make few different designs. I volunteer for Emergency Managment and would like options for powering the radio.

1) Connect a cord through the cover, with inside leads going to the + and - battery springs, the other end of the cord to some C or D sized battery holders with a belt clip on them. My point is that the AA's run down too fast.

2) Install a USB plug on the back such that I can run the scanner off the computer especially when using my VOX recording software. Additionally I have a USB 16,000 mah battery that provides USB power. This should run the radio for a very long time. It is my hope the radio will accept the 5v. (see #3)

3) Like above I would also like to make a cover that has a cord or embed some anderson power poles. I may have to use a small circuit to with a voltage regulator so the radio can be run with emergency power (12V)

Thank You
/Jim /N1CRZ

If you really want a solution for any case, consider making a solution
that uses the side power port so you can replace your scanner with any
other of similar design for backup purposes.

If longevity is a prime concern, you could use a deep cycle marine
battery with a cigar lighter jack that could use a standard cigar
lighter cord/adapter for the scanner that could be used in a car or with
any similar scanner. The battery could also be used with any other 12V
device that uses a cigar lighter plug. You could also use a standard
1-to-3 jack adapter to power other devices.

A key to emergency interops is *not* using custom parts.

Just my 37 cents (adjusted for inflation).

Joe,

You are of course correct !!! I believe the side jack says 6v (800 ma). I guess
I got into the idea because I have a different radio (without a jack at all). In that
case they provide NiCad battery packs and an empty AA with springs that
I modified. I will have to see if the 6v side jack will run from USB power, unless
someone has already done this.

I had two goals:

1) Fixed operation with the audio tied into the computer. I wanted to record our
communications for review later (both emergency and not). I use a program
called "scanner recorder". It has a very nice vox feature with a buffer such that
it can go back something like a 1 second once it realizes you are above the
audio threshold, so you don't miss the beginning .

In this case I didn't want the marine battery there as any
re-charging would give off (Hydrogen) I believe ?? (ie indoor application) and
moving the batteries every time to charge them is difficult because of their weight.

2) I wanted something for the field, belt or jacket pocket wearable. Something
with a curly cord so I can un-clip the radio and change display / modes. I have
used a 7ah hobby sealed led acid before (its a bit bulky and you almost need
2...one on each side else the weight gets a little lop sided and nagging).

The C or D cell solution also means I can either use rechargeable or
pop into a store if needed and get Alkaline batteries and I am back up and

running.

The belt pack I am making will likely run at least 3-4 radios.

- Aviation Talk to Helicopters and other aircraft.
- Ham Communications with Operations Center (EOC)
- Scanner FD is analog & PD is digital P25. (BCD396XT)

- FRS Unlicensed people running shelter(s).

Thanks -- (BTW) Priceless.

/Jim

As you mention, the side jack is spec'ed at 800 mA so the scanner has enough current for operation AND charging. But, if you are not charging then the unit should be about half that which is important because the USB current spec is only 500 mA. So, it may work, but I suspect you may get 'illegal voltage' errors due to the voltage being too low.

You may want to consider simply upgrading to a BCD436HP which will have recording built-in.

Not sure what the mAH rating of Cs or Ds is, but I know some AAs have
been getting up there in capacity, and may rival Cs or Ds. Check into
the capacity of each, as you may be making more work for yourself.
Carrying extra AAs with a 436 may be the most effective solution.

Well, that kinds shoots many of the issues I mentioned above, but the
436 would still have the recording built-in which would be much more
convenient when in the field. AND the 436 definitely will run on USB
power, as it is powered (externally) via a USB port. It should be simple
to get a xV to USB adapter (x = whatever your feed voltage is, but 12V
to USB is very common).

Considering the number of devices you are running, I would suggest
PowerPoles for the connections. You can easily make 'Y' adapters with as
many connections as you want/need.

The side jack is VERY "picky" as far as the voltage is concerened. There is a comparator in the input circuit that monitors the voltage, and if it is anything but 6V, + or - a couple of hundred milivolts, it will shut down the radio and give an error message. So to answer your question, a 5 Volt input just won't cut it.
Bob

I've run mine off a DC-DC converter, worked fine when set to either 5V
or 6V. YMMV.

I have heard of amateur radio (hams) people experimenting with Lithium-Polymer batteries. I was never able to learn what results were gleaned other than a comment that they were able to get a couple of weeks of operation on a hand-held transceiver before needing to recharge. These Li-Po cells are 7 volts per cell and can be shaped to fit different housings. The RC community uses them in their model airplanes and position them in such a fashion which helps when setting up the weight and balance of the airplane. The cells are also lighter in weight. The only downside I have learned is the cells must be recharged in such a fashion as to charge all cells equally, requiring a specific type of charger that "reads" the cells as they charge. If not charged correctly there is a fire and explosion hazard-obviously any battery pack should be charged outside of whatever it powers and I'd go the extra mile, using a metal ammo box (or like containment) to encase the battery in case it does blow and do it outside away from people or property. Any info on these applications where they power scanners or hand-helds would be appreciated.

Hello, I am a new bcx369xt owner, I have a home patrol which is easy to program with my laptop. I bought a used bcd369xt, and it did not come with the programing cable. I bought the cable from Undien, and it came with a serial port connector which my laptop does not have, so I bought a serial port to usb adapter from radio shack and when I plugged it in the software said it was not connected. Any suggestions on how to program it, is there a cable that is made that goes to usb and what is the best programing software to use with the bcd369xt

Hi,

In your message, you mention software giving a not connected error. What software are you referring to?

There are a number of Uniden capable software products. I personally use FreeSCAN 2.15 Written by Assaf Shool which is available free of charge on the Web.

The group will need a bit more information in order to assist you.

Regards,
Dan - W7UP

add your drivers from the radio shack cable, then use a program software like freescan. you will need to set your port so the scanner and computer can see and talk to each other then you might like a subscription to radio reference so you can just download what you want to hear.

HI thanks who answered my questions,

I did instal the drivers for the rs cableand still got the not connected notice, but when I checked further I found that there is another cable sold specifically for the bcd396xt that is for usb connections so I returned the rs cable and ordered the new one.

I did use the free software but broke down and bought the subscription to radio reference to use when my new cable arrives. I may new some help when it comes to using the software for the bcd as it appears more advanced than my home patrol.

thanks

MIke,
What version of window are you running ??? Win XP, Win 7... ect.
in freescan or any other program you need to set your com port by going to
the virtual control icon on the task bar (in the program) and on the right
select the com port setup otherwise it might not make any difference what
cable you use.... once you get the cable installed and connected to the
scanner with it on.

LOL I was thinking same response

One of my favorite sayings is RTFI..... Read the flippin instructions

My advise would be get programming software, fill in freqs and talk groups , download to scanner and enjoy

Either by manually programming (create a new System, then a new Group
within that System, then a new Channel and enter the frequency), or by
software which is much easier and faster (and less wear on the scanner).

^What he said. Beating a dead horse once again to repeat how unfortunate it is for non-technically-minded folks such as I to understand some of the manual - even the easier-to-read version. I’ve had my 396XT for at least three years, still don’t understand how to use the vast majority of what I am sure are useful features & shortcuts, and will hopefully one day find someone with the patience to explain at a level I can comprehend and successfully apply.

The headphone jack is attenuated. If used for an external speaker, the speaker should be amplified.
It's not like the 996XT which has a external speaker jack.

You really can't check the external audio with a standard speaker.
Check it with an earphone to see if the levels are normal or low.

Offhand, I would say the earphone jack is not closing the loop to the
internal speaker. Try plugging in something then unplugging it a few
times to see if you can get it to make contact.

Of course, it could be the speaker itself. I've heard of them going
every so often. Along those lines, make sure all your programming is
using the FM or NFM mode as correct for the individual channels. You
can't rely on the AUTO mode, as not everyone is using the standard mode
for their band.

This is clearly the weak point on that radio model and the 396T. Ive personally seen four, three of em being less than a week old that the speaker is shot. Uniden didnt do their homework on this part and/or their supplier.
Take a look at http://wiki.radioreference.com/index.php/Replace_a_Blown_Speaker_in_the_396
One thing I keep wondering on that is what holds in the speaker?

And see all the others having the same problem - http://www.radioreference.com/apps/Search/?cx=014732645207632841850%3Afkjydvmuoq4&q=396+speaker+replacement+&sa.x=0&sa.y=0&cof=FORID%3A9&name=Search

As I mentioned before - just make sure you are using the correct mode
for the channel. It's quite possible that most of these cases come down
to the incorrect channel settings - specifically, using AUTO or NFM on
channels that are still using FM modulation. This results in raising the
audio level, and while some people endorse that since it results in
louder audio, it might result in higher-than-spec levels going to the
speaker and causing damage.

If in doubt, use FM and not AUTO or NFM.

Changing modulation will only change the volumes slightly, if your using the wrong modulation the audio is only going to change slightly but not completely cut out as was mentioned. This not a modulation issue.
See upman http://forums.radioreference.com/uniden-scanners/144068-396t-vs-396xt-speaker.html#post1066999
"The audio level (volume) will be unbalanced. If the xmit is FM and you pick NFM, it will be too loud as compared to properly demodulated signals. If it is NFM and you pick FM, it won't be loud enough."

Wrong modulation wont make the speaker stop is all Im saying.
Ive programmed about 300 radios and am a database admin at radioreference.

Other thing is when the other faulty radios came to me they all said the same about static, missing audio at times before hand then nothing as was also mentioned originally .

8655. Re: [BCD396XT] Audio

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-12-24 19:16:47 UTC
From: MCH
Topic: 8647 Message: 8655

And "slightly" exceeding the spec is all it takes to blow a speaker if you are close to the limit to star with. Of course, "Slightly" in this case is double the voltage which is what will happen if you monitor a FM transmission in NFM or AUTO mode. It may not sound like much to your ear, but it is greatly different to your speaker. And if the speaker is rated at 5V (just picking numbers for this example), and the normal maximum audio fed to it is 3V you will be fine, but doubling that means you would be feeding 6V which can easily damage the speaker.

Nothing you said invalidates this technical example. I don't see what programming knowledge or being a RR admin have to do with this. In fact, there are lots of incorrect entries on RR for modulation, so I guess if it comes down to an incorrect setting, and it was DLed from RR, that could be a contributing factor. ;-)

But, it is a fact that choosing the wrong modulation COULD result in higher-then-spec levels to the speaker, and it is a fact that higher-then-spec levels could blow a speaker. Just ask anyone who connected a 100W stereo up to a 50W speaker (or even a 60W stereo). It's the exact same theory.

Bottom line is to program the correct modulation for the channel and you should be able to avoid prolonged excessive levels. This is good engineering practice, and I would hope you would agree.

8657. Suggestion to improve programming of hybrid P25 systems

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-12-24 19:07:23 UTC
From: Milton Engle
Topic: 8657 Message: 8657

For UPMan, something for the engineers to think about.

The current layout of programming a P25 site has only a global option to turn attenuation on or off.

A Motorola provided P25 system I monitor is a hybrid, with one site that is standalone (single group of frequencies) and the other consisting of several locations that are Linear Modulation Simulcast (same frequency set at multiple locations).

From a fixed location it is easy to simply pick from either the standalone site which gives very good decoding performance, or if the standalone site cannot be heard, the simulcast group which is a crapshoot for decode performance. If a location is near to the receiver and other locations provide significantly lower signals then the decode performance is fair to good. If however the scanner receives signals from multiple locations at similar levels the decode performance drops like a rock. From my research Motorola systems using LSM are set up to have all sites in phase at transmit, which means that the signals at a radio location may be somewhat out of phase when received. This leads to a limitation of how far apart sites may be located. P25IP systems from Harris appear to use more conventional simulcast technics which focus on limiting the overlap of multiple signals and attempts to keep the signals in phase at the receiving location.

I have found in programming that adding attenuation in LSM systems MAY help, or it may not; each instance is unique.

With regard to the above mentioned hybrid system, one option is to program 2 sites, however this usually means that in areas where both the stand alone site and the simulcast group sites are heard the scanner wastes time trying to scan one site, then the other.

By combining both sets of control channels into a single site the scanner will do a fairly good job of staying on the site that gives the best decode performance and this has been the method I have chosen for portable and mobile scanning.

What would be nice would be the ability to select attenuation based on the control channel frequency entry rather than simply by the site. This would allow me to attenuate the LSM control channel frequencies while keeping the standalone frequencies at maximum sensitivity, thus taking advantage of the best decode on the non-simulcast channels.

Probably not a firmware option since this would significantly change the menu structure, but a suggestion for future product releases.

According to Uniden's manual on the 396XT, the audio output is 310 mW across a 24 ohm load. While the speaker is rated at 0.8 W, 24 ohm. So the unit's max output is 0.31 watts while the speaker should be able to handle 0.8 watts.
So your saying that the other. 49 watts or some 60% will be taken up by the modulation? No, the difference in audio is quite minor, I tried it here. Yes if one runs any component at full power for a long time will further stress a component, but its the high failure rates of speakers that these speakers just arent that great in quality.

Far as saying im a database guy, was just saying about having knowledge. Yes the database isnt perfect thats why we have admins to update it. Theres nothing official about it, its all user generated. If you see a problem, all be it modulation or otherwise , submit the correction is all.

8659. Re: [BCD396XT] Audio

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-12-24 20:11:05 UTC
From: MCH
Topic: 8647 Message: 8659

Well, if the voltage is doubled from incorrect modulation settings, then the maximum would be 0.620W. Granted, that should not be enough to damage the speaker, but it's still running a lot higher than it should be. It could be that the speaker is over-rated and can only take 0.600W which means the incorrect setting would exceed the maximum.

I'm surprised that the speaker is that over-rated. Typical design calls for only a 50 percent over-rating while this speaker is better than 100% over the design power. Maybe they did that to compensate for the issue I've been talking about.

Regardless, my point stands - use the correct mode for the channel and you will not run into over-voltage issues (over-voltage in terms of being more than the designed maximum - 0.310W in this case).

Also granted there are more speaker issues than other issues, but there are not THAT many speaker issues to be termed a "high failure rate" when you consider the numbers that are working fine.

It is a software option to toggle attenuation on/off via Proscan for a particular site

Subject: [BCD396XT] Suggestion to improve programming of hybrid P25 systems
To: BCD396XT@yahoogroups.com
Date: Tuesday, December 24, 2013, 2:07 PM

For UPMan, something for
the engineers to think
about.

The current layout of
programming a P25 site has
only a global option to turn attenuation on or
off.

A Motorola provided
P25 system I monitor is a
hybrid, with one site that is standalone (single group of
frequencies) and
the other consisting of several locations that are Linear
Modulation Simulcast
(same frequency set at multiple locations).

From a fixed location it is
easy to simply pick
from either the standalone site which gives very good
decoding performance, or
if the standalone site cannot be heard, the simulcast group
which is a crapshoot
for decode performance. If a location is near to the
receiver and other
locations provide significantly lower signals then the
decode performance is
fair to good. If however the scanner receives signals
from multiple
locations at similar levels the decode performance drops
like a rock. From
my research Motorola systems using LSM are set up to have

all sites in phase at
transmit, which means that the signals at a radio location
may be somewhat out
of phase when received. This leads to a
limitation of how far
apart sites may be located. P25IP systems from
Harris appear to use
more conventional simulcast technics which focus on limiting
the overlap of
multiple signals and attempts to keep the signals in
phase at the receiving
location.

I have found in programming
that adding
attenuation in LSM systems MAY help, or it may not;
each instance is
unique.

With regard to the above
mentioned hybrid system,
one option is to program 2 sites, however this usually means
that in areas where
both the stand alone site and the simulcast group sites are
heard the scanner
wastes time trying to scan one site, then the
other.

By combining both sets of
control channels into a
single site the scanner will do a fairly good job of staying
on the site that
gives the best decode performance and this has been the
method I have
chosen for portable and mobile scanning.

What would be nice would
be the ability to
select attenuation based on the control channel
frequency entry rather
than simply by the site.   This
would allow me to attenuate the LSM control channel
frequencies while keeping
the standalone frequencies at maximum sensitivity, thus
taking advantage of the
best decode on the non-simulcast channels.

Probably not a firmware
option since this would
significantly change the menu structure, but a suggestion
for future product

releases.

I would like to add that knowing there is a high probability of a wrong modulation entered then Uniden should have made absolutley sure the speaker was good enough to handle that extra load. Just in case of accidental entry.

On Tue, Dec 24, 2013 1:48 PM CST Ronski45 wrote:

>According to Uniden's manual on the 396XT, the audio output is 310 mW across a 24 ohm load. While the speaker is rated at 0.8 W, 24 ohm. So the unit's max output is 0.31 watts while the speaker should be able to handle 0.8 watts.
>So your saying that the other. 49 watts or some 60% will be taken up by the modulation?
No, the difference in audio is quite minor, I tried it here. Yes if one runs any component at full power for a long time will further stress a component, but its the high failure rates of speakers that these speakers just arent that great in quality.
>
>Far as saying im a database guy, was just saying about having knowledge. Yes the database isnt perfect thats why we have admins to update it. Theres nothing official about it, its all user generated. If you see a problem, all be it modulation or otherwise , submit the correction is all.

OR, it could just be a manufacturing defect or poor quality speaker.

From: Ronski45
Topic: 8647 Message: 8663

Ok come on, now your just making things up about the doubling to .62 lol (I did) and the over rated speaker, Omg hehe.
Im suprised you didnt mention tripling, I mean why not? Also you didn't mention about raising the volume to a +3 on individual freqs, channels!
Give the engineers at Uniden some credit since what we're talking about is such a basic electronics item. BTW I do have an electronics degree.

If Upman chimes in I'll take his word as gospel.
Far as the speaker specs, Im sure they just went with what was available at the time. Thats standard practice for projects to lower costs so they dont have to redesign manufacturing equipment to just make a special item.

I agree on your point that says about over driving the speaker, but in this particular case we are talking about it just doesn't apply.

Sure there are other issues, but in the 8 years I've been on radioreference forums and even more years on yahoo groups, speakers, its the one failure that clearly stands out and by far is the top issue, thats obvious if a search is done as well. This includes many years and hundreds of scanners Ive programmed over the last several years. To be fair I have seen one brand new 996XT and a 396T used off ebay both have bad circuit boards that jist plain didn't work. 996xt was under warranty and Uniden overnighted a new one to the guy and the 396T was sent for repair.

I'm sure your reply will try to contradict everything, but your modulation concern just doesnt apply in this instance.

Also this just doesn't help out very much the original reason for this thread.

8664. What to do with my BCD396XT when I get a BCK436HP

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-12-24 23:53:04 UTC
From: <kbarnsda@...>
Topic: 8664 Message: 8664

I am in a little of a quandary. I have bled, like many folks, on my learning curve for the 396XT. I do not, however, wish to toss it.

I generally, in life, would reduce the price of it to $200 bucks and just move on and lick my wounds.

In the case of the 396XT, I hate to do it. Trust me , it is not for the bucks. It is just that the radio is such a treasure trove of unexplored uses. I am thinking of dedicating the 396 XT to many, specific, alternate uses. I am asking via this post for ideas.

One of the things that I have noticed is that new users to the radio, including myself, were totally overwhelmed at first. I still am quite honestly. I live with the manual on my IPOD to refer to.

What I want to try and put together is a series of cheat sheets of VERY EASY to use cheat sheets that even a novice could use.

Here is an example:

Scenario: I have a conventional system called air. I have several frequencies but assume there are more. I want to store them automatically in the Air system group. I also want the scanner to compare to the frequencies already found and if there, not to duplicate them.

Scenario: I want to easily search a pre programmed range of frequencies (3) and have them available to easily switch between. I am going on a trip and want to listen to CB, Ham, and FRS but do not want to tie up my main scanner with crap.

Scenario: I want to easily re assign my 3 pre-programmed ranges in the scenario above. How do I do this?

==========
In the last scenario the cheat sheet would say:
1) press MENU
2) Press Search For
3) Press Set Search Key
4) Select the Key then Select the Service you want

==========

Bottom line, I would use the scanner for certain specific uses as a dedicated machine.

Question... What would be a good way to organize this? and suggested uses?

From: MCH
Topic: 8647 Message: 8666

You're right. There is no difference between FM and NFM. It's all just a marketing ploy. ;-)

And why I didn't triple the figure is because double is the difference between NFM and FM if you believe there is any difference at all. Anyone who knows communications systems will tell you there is. Specifically, the deviation on FM is 5.0 kHz max while NFM is 2.5 kHz max. This translates into a higher recovered voltage at the discriminator which follows down the line to the speaker unless the level is adjusted which is what the mode setting on the scanner does. I'm simplifying this quite a bit but I'm sure some will just say I'm making this whole scheme up, so...

The only reason the speaker issue stands out is because there really aren't any other issues to speak of. It's not as if the speaker issue is common but when it's the only significant issue it stands out like a black sheep among the white herd.

As for not mentioning the +3 increase that's because the spec should take that into account. It would not take abnormal operating conditions into account however. Nevertheless using the volume offset on top of the wrong mode would just add to the likelihood of problems. Every little bit can add up which, again, is my basic point.

If you want to talk about common issues there are other models that have much more common failures - on the order of 10 to 20 times the speaker issue. I will admit that the speaker issue is the most often reported issue but I will not go so far as to say it's a common problem. The speaker jack issue is just as common but still isn't a common failure among units in the field.

Merry Christmas.

> I agree on your point that says about over driving the speaker, but in this particular

case we are talking about it just doesn't apply.
>
> Sure there are other issues, but in the 8 years I've been on radioreference forums and even more years on yahoo groups, speakers, its the one failure that clearly stands out and by far is the top issue, thats obvious if a search is done as well. This includes many years and hundreds of scanners Ive programmed over the last several years. To be fair I have seen one brand new 996XT and a 396T used off ebay both have bad circuit boards that jist plain didn't work. 996xt was under warranty and Uniden overnighted a new one to the guy and the 396T was sent for repair.

Topic: 8664 Message: 8667

Sorry.. Meant to say replacing with a new BCD436HP not BCK.
Middle fingers got mixed up.

8668. Re: [BCD396XT] Audio

Hi,

One factor to take into account with a speaker that is overrated vs the amp output power used to drive it, is the *distortion* generated by this arrangement: this distortion creates harmonics that can be outside the reproducing range of the speaker.

From: Mark Levine, D.C.
Topic: 8647 Message: 8669

Wasn't there also a situation where if you shorted part of the earphone to ground it blew the audio amp, or was that on the 396T?

Hi,

One factor to take into account with a speaker that is overrated vs the amp output power used to drive it, is the *distortion* generated by this arrangement: this distortion creates harmonics that can be outside the reproducing range of the speaker.

8670. Re: [BCD396XT] Audio

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-12-25 03:27:13 UTC
From: Jeffry Rehm
Topic: 8647 Message: 8670

Hey I remember distortion issues from when I was buying stereo gear when I was in high school. Trying to fit the right receiver/amplifier power to the correct set of speakers. Nearly all the salesmen would remind the buyers that distortion will kill a speaker faster than anything else. Just a thought. Glad I could remember that stuff. :)

Merry Christmas

8671. Uniden 396XT for sale

Yahoo group: BCD396XT (2011 — 2014)
Date: 2013-12-27 20:57:42 UTC
From: <seanwfitz@...>
Topic: 8671 Message: 8671

This is a Uniden 396XT digital scanner in perfect condition. I am also including the Butel 396XT PRO software / product key, as well as a bnc antenna, a leather case (this is in used condition - that's why the scanner is mint!). I will also include the usb cable and if you need me to, I will program the scanner for your area. I also have a good set of rechargeable batteries in the scanner that I will include too. There may even be more that just slipped my mind so any questions just call or email. 609-879-4044.

Kathy, you may have purchased one but there are over 2000 other list members and one of them may want one. Not every post is meant for you personally, just as every newspaper ad is not intended for you specifically even if you have a subscription to that paper.

Kathy,

The group will need some information in order to provide assistance.
- What area do you live in?
- What are your scanning interests (Police, Fire, Utility)?
- Are you programming the scanner by hand, or with a computer?
- Do you have software and a cable to program your scanner with a computer?

Regards,
Dan - W7UP

Tom,

This is a link to the Radio Reference page for the LA Co. Sheriff:

http://www.radioreference.com/apps/db/?ctid=201

Judging by the frequency lists, there's a lot going on in LA Co. There are numerous agencies listed on this page, and it appears that most are not trucked systems, which might make the programming a bit easier.

Have you been able to successfully connect to your scanner with FreeScan? That is probably the first order of business, ensuring that you have a connection to facilitate uploads & downloads.

The second would be to create one or more files in Freescan containing the information that you are interested in. That is probably an activity that would be best discussed off-line (not on the list-serve).

There are numerous frequency references available. If you subscribe to RadioReference, I believe they provide the ability to download systems, presumably in the proper format. (I've have not attempted that.) You might start here: http://www.radioreference.com/ and do a bit of research.

73,
Dan - W7UP

Kathy,

Have you attempted to connect to the scanner with your new cable? That is probably the first item of business, other that selection of computer software.

Have you selected software for your computer?

From the Freescan FAQ:

* I get a "Critical Comms Error" when downloading, or channels or groups are missing
Slow down the baud rate you are using. You may also have to turn off turbo mode. Also make sure that no other process has control of the serial port that FreeScan is trying to use. Serial port errors can be
caused by many different things. Most communications problems are caused by old or poor drivers for USB-Serial adapter converters. The most
reliable way to link to your scanner is to use a hardware serial port.

Also, check out this discussion: http://scannow.org/forum/index.php?topic=940.0

Try slowing your com port speed down. This usually fixes data errors when uploading or downloading to your scanner.

Personally, I like the Motorola units, but
Uniden makes an amplified speaker, too.

If you have a set of computer style speakers give that a try. I have had good luck with decent computer speakers and my 396. Of course that might not do well in the car... There a decent powered speaker would help. RS has one that works pretty well but many stores don't carry it (you can order it if needed).

Remember too that the jack on the 396 is actually an earphone jack and is attenuated. You can try grounding the common side of the earphone jack to the antenna ground to bypass the audio attenuator and increase the volume available. It may draw more current from the batteries however.

Thanks Rich. I do have a set of powered speakers on my computer. By using powered speakers, does that help make up for the attenuated earphone jack?
Thanks

Headphone out on any device is not going to provide enough power to drive an unamplified speaker very well. If the jack put out that much power, it would likely drive the earphone's speaker through your eardrum and into your medulla oblongotta.

Paul,
Can you say officially whether or not grounding the common side of the earphone jack to the antenna ground to bypass the earphone jack attenuation will harm the radio on the 396XT? I did this successfully on an older GRE-made scanner years ago with a small gauge wire externally so I could drive a mobile speaker, yet keep the volume from having to be turned most of the way up. I've heard rumors of this procedure damaging the internal components of the XT, yet some say they've done it for years.

Usually that should be enough for most environments. I did that for a while
while my office was under construction and it worked fine. Unless you are
in a real high noise area it should be good.

You can also try speakers intended for iPods etc. They also work pretty
well with scanners.

Like Joe, I've used Motorola speakers with great success and they have good communications audio. Sometimes hard to find at an affordable price, though. I've also used a Radio Shack amplified mobile speaker for years and it does well. The DC power circuit in the RS speaker will shut down the amplifier after a few minutes of no audio to save battery power if the car is off. Comes back to life automatically when the scanner stops on activity.

Good point. I usually associate amplified speakers with mobile use, and I replied accordingly, but for home use amplified PC speakers are a great source of cheap speakers that would work well. If you can get some with equalizers built in, all the better (base/treble control).

I doubt Paul would be able to endorse grounding the speaker shield, as it could imply a "fitness for use" condition that Uniden likely would not want to convey. That said, I see no use for such shorting since amplified speakers work well, and even with the shorting strap you would not have enough power to drive an un-amplified speaker (in most cases). Besides, it would create issues if you want to use an earphone and accidentally turned up the volume - resulting in hearing damage. It's really not worth the risk in my opinion.

You are probably right regarding any "official" answer from Uniden, Joe. Dang lawyers! One use I had for shorting out the attenuation was using a lapel speaker clipped to my shirt collar at outdoor convention-type events. With outdoor noise, etc. I couldn't get enough audio out of the earphone jack for this lapel speaker. Shorting to the antenna ground worked great, and I could swing the wire out of the way when plugging in an earphone. It also allowed the use of an amplified speaker while keeping the volume control turned down to half of what would be needed without the short, thus saving battery.

Personally, I think this hearing damage claim is for the most part bogus, but certainly someone somewhere sued some manufacturer over it, thus the attenuation we live with today. You'd have to listen long and loud to do any permanent damage. My main concern is the rumors that doing this over time can damage something internally on the Unidens. Doesn't seem to be any consensus on this, even on RR.

My solution was similar, but I don't care for wires so I use a Bluetooth speaker mic for my lapel speaker which provides more than enough amplification. A bonus is that my scanner stays at volume level 4 which extends the battery life. When I want to be more inconspicuous I use a common BT earphone that is paired with my scanner and with my phone.

I was under the impression that the 396xt earphone jack was a 3.5 mono not stereo wouldn't you need to buy another adapter?

From: David Johnson
Topic: 8703 Message: 8716

The older scanners were mono, but new scanners have stereo sockets with mono to both sides.

Subject: Re: [BCD396XT] External speaker

I was under the impression that the 396xt earphone jack was a 3.5 mono not stereo wouldn't you need to buy another adapter?

My solution was similar, but I don't care for wires so I use a Bluetooth

speaker mic for my lapel speaker which provides more than enough amplification. A bonus is that my scanner stays at volume level 4 which extends the battery life. When I want to be more inconspicuous I use a common BT earphone that is paired with my scanner and with my phone.

In fact, you would not want to use a MONO plus
since you would short out the audio. You want to
use a stereo jack, so the posted adapter is perfect.

good to know I been adapting it since the older ones RS Scanners I have are Mono...interesting to know since a earpiece is generally mono, headphones are stereo or as David put it mono on both sides.

Thanks

Mark

From: <kbarnsda@...>
Topic: 8703 Message: 8719

Hello,
What I did was go to Radio Shack and buy a cassette adapter. In case you have not seen one before, it is an old time cassette with a cord stuck in it that has a plug on the end. You put this in your car's cassette player and then plug in your scanner. This is of course assuming you have a car with a cassette player still.
My suv has both a cd player and an old time cassette player.

Perhaps you car has an input for an MP3 player? My older car had this and I would just use a male/male cord to plug into the car.

This would annoy the daylights out of my wife so I can only use on trips with my daughters as they don't mind.

You do get extremely good reception and one of the things I especially do like about the 396XT is that it does not have annoying background noise, popps and hisses like all my other scanners did,

You can also go to Amazon and search for powered speakers. They do work but I got tired of the battery issue.

Hope this helps,,, CHeers

Any speakers designed for use with computers will work fine. I've used an inexpensive Logitech pair from and another cheap pair with no name on them. I also use a radio shack powered speaker in the car and they all work fine..

Yes, old is good I have one of those critters and that is all fine until my wife or daughter get in and think they have to take over.
years ago I had a mobile radio and a cheap truck stop am/fm radio and I don't remember how I did it but you could listen to the radio all right but as soon as the scanner talked it would cut the radio off and send the scanner audio through I thought it was hysterical when people would pop their asses into my car and think they were taking over and it would cut their music until it was through matter of fact I'm still laughing at the very thought and that must of been 30 years ago.

wish I could remember....anybody got any ideas? I remember the older chrysler had a am/fm with a cb and it would cut off the audio when you keyed the mike.

The Radio shack/Realistic "CB Standby switch" while it was sold to allow the CB radio breaking squelch
to switch the speaker to the CB radio , so you could hear the CB .without other radio or stereo noise

Years ago
I used it to turn on a cassette tape recorder so that it would record the scanners transmissions during the day when I was at work, so I could document the scanner traffic .
 without recording hours of nothing and running out of tape. worked well,

here is one from Ebay

http://www.ebay.com/itm/Realistic-21-580-CB-Radio-Standby-Switch-Tandy-RS-NOS-late-70s-NEW-/261359577788

Order online from Walmart the UNIDEN BC23A amplified external speaker. It sells for $30.88. I have one and it plays very well on my motorcycle. It comes with a stereo plug and I use it with my HomePatrol1. The speaker requires 12 volts DC. It is loud enough to overcome the noise of the bike and road noise. Another alternative would be a Bluetooth transmitter and headset but some states have laws against headsets on motorcycles. But your application is different.

I have a BCD 396xt and was wondering if anyone knows an "easy" way to program the unit---the manual is very confusing ;-(
What I want to do is put the mostly conventional systems into groups---where I can put all my counties in the scanner and being able to enable/disable the county in my travels. I can easily do this on my RS Pro 97 scanner, I am using the Butel Basic software. There was a step by step description on YouTube but they must have taken it down.

From: jcarter0@swbell.net
Topic: 8728 Message: 8728

I'm looking for a way (program)to monitor the data channel and log talk group ID's. I'm using FreeScan and ARC ST Pro to program and have no problem with programing the scanner. I'm importing the systems from Radio Reference, but I'm looking for TG ID's that may not be documented.

Won't running the trunk system in "Search" mode do that for you?

Topic: 8726 Message: 8730

Step-by-step would be:

Hit the MENU button
Select PROGRAM SYSTEM
select NEW SYSTEM
select CONVENTIONAL
(confirm the selection)
select EDIT GROUP
select NEW GROUP
select EDIT CHANNEL
select NEW CHANNEL
enter the frequency

For the other channels, select NEW CHANNEL when in the channel edit menu, and for the next group back out and select NEW GROUP in the EDIT GROUP menu.

Etc.......

I can help you program your scanner by connecting to your computer etc...I own a computer repair shop and it wouldn't take long to set it all up. You can contact me off list if you are interested. Most online scanner "Stores" charge alot of money for the programming service and you have to send the scanner to them hence you will be without the scanner for weeks.

You can contact me offline at: seanwfitz@gmail.com or sales@tuckertontechcenter.com

Good luck,

KK6IHG ~ Joe here, SF Bayarea, California. Up for grabs a relatively brand new Uniden / Bearcat 396XT handheld APCO25 Digital Scanner. This is the full XT version, as pictured. Comes with the full retail assortment + the original box. Not much use, but I did notice on inspection that it has a rough spot on the right back corner, don't know if it was a case flaw or what - cosmetically you would need to actually look for it to see it. Other then that it's about a 99.5% just because it has been out of the box. kk6ihg(at)gmail.com or text to 510.470.5070 // $320.00 shipped/insured to your loc.(Lower 48) If your local and want to pick it up, it's 300$ I put a link to it below on Square market (also hosts the pics of it) - if you want to pay via MC/VISA/AMEX, USPS money order is acceptable, will ship within 2 days of payment deposit confirmation (funds deposited and available.) Uniden 396XT APCO25 Scanner on Square Market (https://squareup.com/market/joe-frischerz/uniden-xt-apco-scanner) Cheers, 73

Yes. And if you also lock out all the programmed ones. then you will be left with only the unknown ones in the log.

8735. Unable to decode

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-01-06 23:16:53 UTC
From: Ben
Topic: 8728 Message: 8735

Hi,

I have been using the BCD396XT for a while now and been very happy with it. I am really pleased with FreeScan and how I can export and import data from it.

There are a lot of digital frequencies that I am unable to decode. I know that perhaps some of these are scrambled, however given the industry I work in, I do know that not all of these are scrambled and it is my scanner that is having trouble. This is more than likely because I haven't programmed it correctly.

I live in Melbourne Australia and know there are a few in this group in the same location.

Attached is a list of frequencies I am unable to listen to with some examples on how I have programmed them (see second tab). Any help would be greatly appreciated. I have tried putting them into new systems (such as P25 Standard Digital xt) with no luck.

Regards,

Ben

Don't see any list, and I'm not familiar with what system types are used down under, but remember that scanners can only decode P25. They can't decode other digital forms such as DMR, D-STAR, TETRA, or others.

8738. Re: [BCD396XT] Unable to decode

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-01-06 23:43:30 UTC
From: MCH
Topic: 8728 Message: 8738

That list isn't very readable, but where you have SRCH is that CTCSS/CDCSS SEARCH? If so, the scanner won't even try to decode P25 since you're telling it that it's an analog channel. If it's NAC SEARCH, that is OK.

8739. Re: [BCD396XT] Unable to decode

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-01-07 00:16:18 UTC
From: Ben
Topic: 8728 Message: 8739

Thanks Joe,

Yes I have SRCH in the NAC when I am unsure what the NAC is or the scanner can't find it.

I attached the list, but yahoo removed it, If anyone lives in Melbourne and would like it, please let me know your email

Benwork@... [1]

That list isn't very readable, but where you have SRCH is that CTCSS/CDCSS SEARCH? If so, the scanner won't even try to decode P25 since you're telling it that it's an analog channel. If it's NAC SEARCH,
that is OK.

8740. Re: [BCD396XT] Unable to decode

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-01-07 06:18:15 UTC
From: OB
Topic: 8728 Message: 8740

Not in Vic but I believe a lot of stuff down there is also encrypted.

2a. P25 Data Channel Monitor
Posted by: "jcarter0@..." jcarter0@... jcarter0@...
Date: Mon Jan 6, 2014 8:24 am ((PST))

I'm looking for a way (program)to monitor the data channel and log talk group ID's. I'm using FreeScan and ARC ST Pro to program and have no problem with programing the scanner. I'm importing the systems from Radio Reference, but I'm looking for TG ID's that may not be documented.

Try this.

http://www.psredit.com/pro96com/

Greg

Hi all.

Does anyone know a source for these in Australia? Overseas suppliers seem to want a fortune to send one here.

Thanks

I did just a search on http://www.ebay.com.au/ for Uniden USB-1 Cable.
Found 3 seller for under au$35 and 3rd one had cheapest postage around au$12

I could not get Pro96Com or BCTool to work, no matter how hard I tried....then...rethinking this, the system I was trying to monitor is Motorola Type 2 Smartzone. Sometimes its the little things that get you. I did find UniTracker will do what I need...Thanks for the responses, and any other program suggestions would be appreciated.

SUCcESS!!!!!!!!!!!

I got the freq info from Radio Reference and downloaded each county into banks..and the info seems right ;-)

One question.....How do I get the frequencies to read out??? AND how do I get the scanner to scan UP. Right now it's scanning DOWN ;-(

Bob

In a message dated 1/11/2014 1:28:54 P.M. Eastern Standard Time, capt_clint@... writes:

Yes, I have ARCXTPro. Did you load the file I sent? Have you tried to create a system as I described? Have you got the software communicating with the scanner? That can be more challenging than the data entry. http://wiki.radioreference.com/index.php/Connecting_scanners_via_USB

It is really very simple once you see the underlying structure. Systems(Banks) are like the main folder on a PC. Groups are like sub folders into which you put the frequencies for the system(bank). You need at least 1 group for every system. Once you have that under your belt, then it is just a lot of typing.

You really should save yourself all that mind numbing data entry with the potential for mistakes, and get a premium RR membership for $7.5

I would describe it is clockwise for up, and counter-clockwise for down.
(looking at the scroll knob from above).

Looking at the front of it, left would be up and right would be down.

Does anyone know if Plant City has switched to a new system? I had been using the three conventional frequencies they use for EMS, Police Dispatch, and Tactical I got from RadioReference. I was over there Saturday and didn't pick up a single call all day. I know it's not a big town but in the past there has always been some activity. Did they switch to the Hillsborough trunked system or what?

RadioReference lists Plant City as part of the Hillsboro County Public Safety system (http://www.radioreference.com/apps/db/?sid=220). This doesn't appear to be a recent change, as the Downloads page for the system shows history changes in 11/2012 related to Plant City. You may want to try that system.

It appears they have talkgroups on the Hillsborough County EDACS system also. So being up here in Ohio and not down there in the Tampa area I would suspect they are on the TRS and not using the VHF frequencies listed in the database anymore.

Hope that helps point you in the right direction.

I have a BCD396XT. It " scanned" from one Quick key to another for systems or sites when ever I turned them on by pushing the scan button. But now it will only stay on one Quick key site or system and not move to another. Even when their available or turned on. What button did I accidentally push to stop all the Quick keys from scanning that are on? What do I do to correct the problem? I hope I'm making myself clear

I 'm a rookie at this.

Thanks for any help you can give me.

Mike

It sounds like you activated System Hold. Is the HOLD icon flashing?

If so, press the HOLD button for a few seconds until it turns off (2-3 seconds)

If, as you say, all settings are by the book, check your USB ports... no little triangles indicating a problem? You may have no issues with the scanner programmer program, rather a problem with the USB ports. It's happened to me and fixed by restoring drivers for the ports. But first try assigning the port you use manually.

Hi, I had this problem with win 8. I bought new USB leads as the ones I had would not work. Driver issues and fake chips. I found the ones from Starteck.com work well.

If, as you say, all settings are by the book, check your USB ports... no little triangles indicating a problem? You may have no issues with the scanner programmer program, rather a problem with the USB ports. It's happened to me and fixed by restoring drivers for the ports. But first try assigning the port you use manually.

It would help if you would please list the steps you have taken as part of the "whole ritual". If you in fact have done everything then you should, by process of elimination, have identified if the problem is the scanner, the cable, the PC, or the software.

What I meant was IF the problem is with the USB ports, do a search on the web, not just this news group, for a fix. As it may be a computer USB port problem which has nothing to do with the software used to program our scanners. I don't remember the advice I got but do remember using this suggestion I submitted here to fix it.

I'm guessing you mean for the frequencies to read out on the 396XT when it isn't connected to the computer. To toggle through the screen options, press the function key and hit 6. I think the second display option will give you the alpha name in large print, with the frequency or talkgroup number in smaller type below and left of the alpha tag for that channel.

8779. FreeScan GPS system plotter

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-01-29 05:29:45 UTC
From: Earl
Topic: 8779 Message: 8779

I am trying to program using FreeScan and am able to program the radio without any problems but when I try to look at the GPS system plotter to see what a large system looks like on the map it never pops up. I was wondering if anyone else has had this problem? I am using Windows 7.

I get the map view and the map shows up - but at the top it says internet connection required which all of the computers I have tried have been connected to the internet. I have made sure that the system I want to view does have the site gps information enabled.

Thanks for any help.

Earl

It is an I-call. The SRC stands for "source" and the DST stands for "destination". I-call is similar to a phone patch. But I am sure that is a bad analogy and someone here will correct me. Sounds like a good catch.

As others have mentioned it is an I-Call. This is a call between two individual radios that is not heard by other system users' radios. Sometimes they call it Private Call or other terms.

From: Levi
Topic: 8785 Message: 8785

Something has happened to my two computers that worked last week to connect to my 396XT scanner.

I use Win 8 Pro on both computers, one on 64bit and one 32bit. Same cable as last week and one computer has had no changes to any software.

In the Prolific USB-to-Serial Comm Port in Device Manager I have a yellow exclamation point. The error is "This device cannot start. (Code 10)". Google of this on Prolific site talks about copycat device software from China. But my drivers did not change since it last worked. Since the problem, I have uninstalled version 1.1 and installed version 1.9 of the Prolific software. Not change in error messages.

Does anyone have a clue of this problem? I have restarted computers, reinstalled drivers but cannot connect to the com ports.

Thanks in advance.

Sounds like a feature I need to have. I'm in the process of programming
in a large (and new) trunked system here in Victoria, Australia. Need
to group the sites so I can reduce the number scanned to those in the
area I'm in. At this time, I don't have access to a suitable GPS, so
will be doing that side manually, and need to know what site is where.
The tedious part of the programming.

With what looks like 200 odd sites when the system is fully operational,
I have to whittle them down. :)

If Windows did an update recently, it might have also updated your
driver. If so, you'll need to reinstall the drivers that previously worked.

Continuing to struggle with this. Yes, I have removed Prolific drivers, rebooted pc, connected scanner and then reloaded driver file. I even tried this off-line to avoid Windows from downloading updates before I could test it with the old file that worked before something corrupted the driver on two PCs.

Still not working. I looked at the proposal below, but the file they suggest requires a third-party ad-supported downloader. I don't trust that as the file should be pretty small and not required a virus or spyware install to download the file.

Anyone else have any help?

Thanks!

Something has happened to my two computers that worked last week to connect to my 396XT scanner.

I use Win 8 Pro on both computers, one on 64bit and one 32bit. Same cable as last week and one computer has had no changes to any software.

In the Prolific USB-to-Serial Comm Port in Device Manager I have a yellow exclamation point. The error is “This device cannot start. (Code 10)”. Google of this on Prolific site talks about copycat device software from China. But my drivers did not change since it last worked. Since the problem, I have uninstalled version 1.1 and installed version 1.9 of the Prolific software. Not change in error messages.

Does anyone have a clue of this problem? I have restarted computers, reinstalled drivers but cannot connect to the com ports.

Thanks in advance.

You must also remove the DEVICE in device manager, not just uninstall the drivers.

Of course, if you are using the same USB to serial adapter cable with both computers, there is always a good possibility the adapter/cable itself went bad.

Fixed for now. I deleted ser2pl64.sys from \windows\system32\drivers. Reinstalled the original Uniden PL2303_Prolific_DriverInstaller_v110.exe I downloaded on 3/11/3010.

It still picked up the ser2pl6464.sys driver again and gave me the yellow exclamation point. I went into the driver properties on device manager and “rolled back” the driver to the original Prolific 3.3.10.140 version with a 11/19/2009 date.

System is now working, but some sort of Microsoft update or other jolt will probably update it again to Prolific 3.4.62.293 update which my Windows 8.1 Pro 64 bit does not like.

Some smarter person will probably find out how to make this more reliable.

Thanks!

What type of software do I use to be able to down load frequencies to my scanner. Also is there a book that simplifies how to program my scanner ?

FreeScan interfaces with RadioReference to download frequencies and then
you upload programming to your scanner.

Hi Wes...I have owned my 396XT for a little over a year there are two schools of thought to program it...Freescan which is free but I don't see import from Radio Reference's database in it. The latest version 2.16 got flagged my my antivirus. Next there is ARC-XT Pro this program works like a charm and is easy to import systems and upload them to your scanner effortlessly.. you can select only what you want and put them in. This costs about 35 bucks but well worth it.It uses the radioreference.com database. As far as books and manual input...personally don't know of books and manual input...not for me! Hope this helps, John

Hi David,

1.11.01 is the current firmware version if I'm not mistaken (I've upgraded to this one last weekend in fact).

Updates are cumulatives, you don't have to add them sequentially.

Cheers!

Free has import function. Under FILE then import you can select what you want to import, like a file from freescan or Radio Reference. It works fine, I have programmed several scanners with it.

For software, I use Freescan. Works well with the 396XT and also Radioreference. You will need a premium Radioreference.com subscription to be able to use the download feature.

It does but if there are more than 20 groups it wants to truncate it...what
is the work-around on that.

The XT only supports 20 Groups. If you have more than
that you will have to import into more than one System.

MCH,
I guess I don't fully understand. I am trying to put the new Missouri Statewide System called MOSWIN into it I really only need Troop D as a general rule except when I may travel to my uncle's and then TRP A & H would be nice.
I would use the Kansas KSICS as well when I travel to my mother's and Mother-in-law's but I still can't figure that out either, and really don't expect to travel to any where else that this scanner is pre-programmed except maybe to Oklahoma or Colorado, I keep on initializing and then I have the lengthy task of deleting/locking out those extra folders every time I update the system (MOSWIN) quite a task if I say so myself. I use freescan and think there should be a easier way to just send a update to the radio.

Mark

If this is something you or someone in the group could help me with please feel free to e-me ofline if necessary.

Respectfully,
Did you ever think of selling the 396? I am a retired system analyst. I only mention this as I have a rudimentary ability to learn. The 396 is a beast. I sold my Home Patrol to buy the 396. I felt the Home Patrol was nearing the end of its life cycle and I wanted to position myself to buy the next offering from Uniden...ie the 436. It is, to the best of my knowledge, a mixture of the best of the Home Patrol and the 396.

Now I have a 396 which I will probably not use. I am planning to buy the 4 or 536. I actually partially placed an order for the 436HP last night and cancelled at the last minute. I am torn between the 2 of them.

Great...but how does this apply to you? From what I understand after watching all the 436 videos that have been posted to date, (6-7 good ones) and what I know from having owned the Home Patrol, and the new "logic" of the 436, it would be a snap to do what you want.

Having bled for several months, and continuing to bleed and discover new tricks, you could fairly easily do what you want with your 396. You would need a membership to Radio Reference and get a copy of Freescan. It is extremely easy to use and I have found more help with this program than others. I do own 2 other versions of software. Each has its own nice features, but Freescan would do the job for what you want.

You should actually play with it for awhile and get used to the logic and features. Nothing helps but RTFM however there are no "Cliff Notes" for it. Once you understand how it works, you will wonder how it seemed so hard. Having said that, the only problem with the 396, IMHO, is that it has way way too many features with too small a screen and too many buried menus. You can get around with free scan however.

I have a set of cheat sheets I print out on sticky labels and attach to the back of the scanner for the actual "load" I am using. I have a situation fairly similar to yours. When I go to city A, I have a set of towers I want to hit and a set of ID's I want to listen to for that location. When I go to city B, I have yet another set. When I travel to Denver, I have a totally new set of services that I want to listen to.

I also have learned to use the search and store fairly effectively for finding ID's I was not able to come across in other sources.

I also have put a fair amount of time into learning how to use the Radio Reference Database, and import it into FreeScan. Freescan also has a feature called EazyGrab. It is extremely useful for adding conventional channels you find. It is worth the small amount of time learning how to use it.

Hope this helped. The main thing is don't feel stupid. Until you learn the 396, folks will correct your "grammar"
I still refer to talk groups, and banks, and uid's incorrectly.. but I know what I mean in my head.
It actually is quite nice once you get used to it. Ever have a RPN calculator?

I probably am going to keep my 396 and use it solely for searching for frequencies and a backup scanner... hence my delima in deciding between the 2 new models.   I think the bigger screen of the 436 is going to win out however.
I also am worn out figuring out who what when and where I am going. I much prefer to enter a zip code and range.
I am getting too old for some of this new stuff.

Yes, the thought has crossed my mind several times, so had seeing how well it would do being dropped out of a 12 story window.
but, be that as it may I still need a scanner capable of receiving the 700mhz freqs that a lot of our state entities are going to.
I have several realistic scanners and are extremely familiar with their protocol but I have only owned 2 uniden scanners in my lifetime and I gave the first one to my mom it was only able to receive conventional frequencies anyway and she lives in a small town so their next step is probably to the 800 mhz because I don't see them being able to afford the new system radios for Kansas.
I lived in SE Colorado for several years and moved from there about 25 or so years ago they were still in the conventional stage at that time too.

No, I have never used a RPN calculator.

seems to me that one would be at the mercy of what was available if they used a zip code and or GPS coordinates

The HP is far from the end of its "life cycle" and in fact any scanner still in working condition is still very usable.

Re:" seems to me that one would be at the mercy of what was available if they used a zip code and or GPS coordinates "

Having owned the Home Patrol, it an extremely nice job. You have the option to select from many services.
I never felt limited. You could add your personal "favorites" and add to the ones automatically selected.
The reason I wanted the 396 was something to play with. I had already learned from my Home Patrol the TGID's of what I wanted to listen to.
I wanted a little more flexibility and was willing to trade the ease of use for the time being. I thought Uniden was going to come out with a new Home Patrol rather than a BCD436HP. I was able to get a fairly good price for my Home Patrol.

Don't throw the 396 out the window just yet. I said there was no Cliff Notes for it but actually there is an easier to read manual.
It still is fairly hard as the radio does so much. I never use all the features of it.
IMHO it should never have been sold without software to program it. Having said that, Freescan does a nice job. I did donate a few times to the chap as I thought he had done a nice job and I just wanted to.

Try this link.... http://marksscanners.com/396XT/396xt.shtml

Try this one as well http://www.radioreference.com/apps/login/

The best money I ever spent was subscribing to Radioreference. It truly is a snap.
You have the choice of directly importing CONVENTIONAL or TRUNKED systems directly.

All you have to do then is assign your quick keys. They are sort of like "banks" in older scanners. Remember to assign the quick key to the "site" when using digital and the System when using analog.
It was the only thing that really tripped me up initially.
Also, send an email to the author.
He responded very rapidly to me (before I donated anything) and others on this board have quite a good knowledge to help.
Good luck +)

8824. Managing a large trunked system.

Yahoo group: BCD396XT (2011 — 2014)

From: Tony Langdon
Topic: 8824 Message: 8824

I've had my BCD396XT for a few years, but it's only now that I'm actually starting to use it for what I bought it for - digital P25 monitoring. Our fire services are in transition from a conventional analogue network to trunked digital across most of the state (for those unfamiliar with the geography, an area about the size of Great Britain).

Radioreference has some of the sites (53 at this time) in its dagtabase, as well as all of the TGIDs, and the source RR draws most of its info from lists around 200 sites, but RR only has the ones with all of the details confirmed. I know through internal sources what TGIDs I'm interested in (actually not a huge number to choose from - most of the time, only need one).

So far, everything seems to be working. I'm able to get a good signal from a couple of the nearby sites. Haven't heard any traffic yet, because the system is not yet officially in use, but should be able to arrange a test.

When the system get to 200 sites, I'm wondering what the best way to manage them will be. At 53, I'm using site quick keys to turn only the local ones on, but there's only 100 quick keys AFAIK.

Any other tips would be appreciated.

I’m in Henderson County, NC 2 miles from Buncombe County. Since Newton's HP communications replaced Asheville’s, reception is more & more maddening. Stops during transmissions (Newton & cars), sometimes followed by motorboating/static, sometimes not. Particularly evident when Newton or car are awaiting reply, which either starts then stops, or begins with motorboating, then transmission begins mid-sentence, and seems as likely to stop as not, with motorboating, followed by silence. I’ve changed no settings. I don’t even know what settings to change. I’ve not tried “this” or “that.” I don’t know what to try.

My paycheck came from driving a fire truck, making my techno IQ somewhat akin to R2D2’s & C3PO’s third-cousin-twice-removed (that’s just me – no offense to my more-educated fellow firefighters), so please tailor your responses accordingly. Lest you think I jest, I still don’t know how to use the keypad to facilitate quick reception of agencies, so that should give you some idea of what you’re dealing with here. Amuses me when folks say they can’t imagine manually entering the needed info, that they must rely on FreeScan or such. I’ve used FreeScan, & it can certainly be helpful, but it’s also frustrating at times. I’ve entered the vast majority of everything by hand. Yes, it’s my fault for not learning all the tricks, but Latin wasn’t offered when I was in school. Tried the “easier” manual, which worked great as kindling fuel. I register for Medicare next month.

At that many sites the best way to handle them might be to get a BCD436HP.

Ok. You just asked for the best way. I didn't see any restrictions in
the question, and the HP series handles large systems much better.

Second best way is to duplicate the system based on locations, or zones.

What I did was split the statewide system up into three systems. Works great on the 396 with 147 sites.

Given this is the BCD396XT group, one could assume an answer was to
involve this scanner. :)
>
> Second best way is to duplicate the system based on locations, or zones.
That could work rather well actually, especially since I know the
internal administrative boundaries. There are a couple of possibilities
here. One is to use our "regions" which would create 5 or so zones to
spread the systems out in. Even better would be to create 20 systems,
each corresponding to a district. This arrangement could work
particularly well, given that the dispatch areas are broken up by
district, then I could simply turn the district I wanted on or off by
quick keys. A bit more work, but could be worth it in the long run.
Also means I don't have to remember which sites I'm close to. I can
work with more familiar boundaries.

I may go even more radical, to have the scanned sites correspond with
dispatch districts in separate systems, as I explained in my previous
message.

Thanks to both of you for the tip. :)

Look at the database on radio reference and see if they are encrypted, which will be noted in notes or by an E next to TGID's for any encrypted vhannels.

Subject: [BCD396XT] Managing a large trunked system.

I've had my BCD396XT for a few years, but it's only now that I'm actually starting to use it for what I bought it for - digital P25 monitoring. Our fire services are in transition from a conventional analogue network to trunked digital across most of the state (for those unfamiliar with the geography, an area about the size of Great Britain).

Radioreference has some of the sites (53 at this time) in its dagtabase, as well as all of the TGIDs, and the source RR draws most of its info from lists around 200 sites, but RR only has the ones with all of the details confirmed. I know through internal sources what TGIDs I'm interested in (actually not a huge number to choose from - most of the time, only need one).

So far, everything seems to be working. I'm able to get a good signal from a couple of the nearby sites. Haven't heard any traffic yet, because the system is not yet officially in use, but should be able to arrange a test.

When the system get to 200 sites, I'm wondering what the best way to manage them will be. At 53, I'm using site quick keys to turn only the local ones on, but there's only 100 quick keys AFAIK.

Any other tips would be appreciated.

8835. HEADS UP! RE: [BCD396XT] Computer & Scanner connection

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-02-02 18:52:51 UTC
From: USLevi
Topic: 8835 Message: 8835

I did some more investigation on the issue mentioned below.

I was again offered an update of Prolific drivers in my Windows 8.1 system through Windows Update. I chose to do the update as a trial. Sure enough, when you reboot your PC after the install, I can no longer connect the computer to my scanner.

The fix for this is to go into control panel, select system and select device manager. Scroll down to Ports (COM & LPT) and you will see the yellow exclamation point. Right click on it and go to properties. Select the driver tab and click Roll Back Driver. That will take you back to a working system.

To avoid this update in the future, go to windows update and right click the prolific upgrade message and select “hide update”.

Maybe your system could take the 10/17/13 drivers from Prolific, but mine can’t.

73s!

Subject: RE: [BCD396XT] Computer & Scanner connection

Fixed for now. I deleted ser2pl64.sys from \windows\system32\drivers. Reinstalled the original Uniden PL2303_Prolific_DriverInstaller_v110.exe I downloaded on 3/11/3010.

It still picked up the ser2pl6464.sys driver again and gave me the yellow exclamation point. I went into the driver properties on device manager and “rolled back” the driver to the original Prolific 3.3.10.140 version with a 11/19/2009 date.

System is now working, but some sort of Microsoft update or other jolt will probably update it again to Prolific 3.4.62.293 update which my Windows 8.1 Pro 64 bit does not like.

Some smarter person will probably find out how to make this more reliable.

Thanks!

You must also remove the DEVICE in device manager, not just uninstall the drivers.

Of course, if you are using the same USB to serial adapter cable with both computers, there is always a good possibility the adapter/cable itself went bad.

I don’t know. I’ve had it for maybe three years. Got the cable when I bought the scanner from Amazon.

Have you been able to upgrade to the newer drivers with Windows 8.1? I’ve read about the diagnosis being counterfeit chips. I just don’t know.

Seems the site RR draws its info on is pretty comprehensive. No point putting myself in the loop, because RR already references the source. The only reason RR's database seems to be "behind" is they're taking care to include sites for which there is complete information. The source website includes many sites with incomplete information.

The symptoms suggest this. I have one of those (not sure where I got it
from originally, just remember finding it in a box of cables), and had
to install an older driver on my Vista machine. I'm currently not using
this adapter, because the PC with the scanner has a real COM port which
was free, so I simply plugged the scanner's programming cable in there. :)

Ok. If its an older USB-1, it uses a chip which does not support Windows 8. You will need a new model USB-1. No, I don't know how to tell the newer version. They should have called it USB-2.

I downloaded the Prolific v3.2 driver because my computer didn't have a driver to roll back to... Installed the older version and was good to go. BUT... Make sure to turn OFF automatic updates in Windows 8 or 8.1. Or it will reload the latest driver which don't work!

just a bit of info - I have the older version with the old chip. I purchased a new computer a couple of months ago and the cable magically would not work anymore. I was going to buy a new cable but after reading around trying to make sure I wouldn't wind up with the same issue. I downloaded this file and did the install and wouldn't you know it, my old adapter worked again. Here, hope this works for you too

Subject: HEADS UP! RE: [BCD396XT] Computer & Scanner connection

I did some more investigation on the issue mentioned below.

I was again offered an update of Prolific drivers in my Windows 8.1 system through Windows Update. I chose to do the update as a trial. Sure enough, when you reboot your PC after the install, I can no longer connect the computer to my scanner.

The fix for this is to go into control panel, select system and select device manager. Scroll down to Ports (COM & LPT) and you will see the yellow exclamation point. Right click on it and go to properties. Select the driver tab and click Roll Back Driver. That will take you back to a working system.

To avoid this update in the future, go to windows update and right click the prolific upgrade message and select “hide update”.

Maybe your system could take the 10/17/13 drivers from Prolific, but mine can’t.

Subject: RE: [BCD396XT] Computer & Scanner connection

Fixed for now. I deleted ser2pl64.sys from \windows\system32\drivers. Reinstalled the original Uniden PL2303_Prolific_DriverInstaller_v110.exe I downloaded on 3/11/3010.

It still picked up the ser2pl6464.sys driver again and gave me the yellow exclamation point. I went into the driver properties on device manager and “rolled back” the driver to the original Prolific 3.3.10.140 version with a 11/19/2009 date.

System is now working, but some sort of Microsoft update or other jolt will probably update it again to Prolific 3.4.62.293 update which my Windows 8.1 Pro 64 bit does not like.

Some smarter person will probably find out how to make this more reliable.

Thanks!

You must also remove the DEVICE in device manager, not just uninstall the drivers.

Of course, if you are using the same USB to serial adapter cable with both computers, there is always a good possibility the adapter/cable itself went bad.

I hate to see a company take advantage of Windows 8 to sell new chip cords. No bother, you can use the older cable USB-1 with the Prolific 3.3.10.140 version driver with a 11/19/2009 date. It works fine with Windows 8.1. Just right click it when offered a newer version in Windows update to hide it from future updates. Never stop Windows Update from operating as there are many updates you need for your computer’s safety and your security.

Have a great day!

Ok. If its an older USB-1, it uses a chip which does not support Windows 8. You will need a new model USB-1. No, I don't know how to tell the newer version. They should have called it USB-2.

Microsoft is all about the money, not the users. If only they had made Windows 8 compatible, this would not have been an issue. And people wonder why I dislike USB so much... (Custom drivers that mat not work on the "next version" of Windows)

Don't blame Microsoft, blame the manufacturer of the adapter for not updating their drivers and submitting them to the hardware lab. Things change, the computer that ran my 2003 Jeep doesn't work in my 2006 Jeep without reprogramming it. Same with USB drivers, they need updated too.

Just a word to the wise.... If you are considering Butel's ARC-XT software be aware that it has a serious bug that prevents you from printing out a copy of the groups you have assigned to the sites. For me that's a big inconvenience and a big disappointment for something I had to pay for. I feel like I paid to be a Beta Tester. They say it will be fixed in the next Build but can't say when that might be. The drift I get is that they don't care enough about their customers to fix this with a quick patch or whatever. I'll never buy any software from them again.

I have to agree with you with regards to the arc software in my opinion
their customer service is non existent I've only had a couple of issues
with the software over the past few years but after emailing and finally
getting a response there was no help what so ever I had to figure out the
cause and fix myself good luck with the with that

First, as this is the first I have heard anyone mention this problem, they must figure it is low priority to fix. Secondly, it is not 100% true. WhenI tried to print a system, it did not print. BUT, I have several “Document” printers and it worked fine for them. The first one I tried was a PDF printer from Foxit software. It created a pdf with all of the information. Next, I tried the Microsoft Word xps printer, and again, it created a correct document. Lastly, I tried “Send To Onenote 2010” printer, and it created a page in my Onenote library. So, it has no problem printing as long as if is printing to a document, which suggests that the bug has to do with the interface with a hardware printer. The solution to your problem is to get a pdf printer, you can then print the pdf file. The one problem with printing with this program is that you cannot change the printer, so you need to go to the Control Panel, Printers and Devices, and set the Pdf printers as the default, remembering to set it back to the original printer when you are done. One advantage of the pdf printer is that not only can you print it, but if you have a smartphone or tablet, you can read it there.

I know they are working on software for the 436/536, so they may be too busy to deal with this right now……

Butel uses beta testing as part of their finalization process. They freely admit to this. Not saying if it's right or wrong, just a different approach. As I use RT Systems software for all my ham stuff, I would love it if they also did scanners-but they don't. Butel is in my opinion, the next best thing for scanners. As for printing, given enough time, all concerns do get addressed after researching. I have submitted two issues with the newest BCDx36HP software and one has been answered and corrected. The other was submitted yesterday so it's too soon to tell. (Upper/lower case selection=corrected. Cutting and pasting=still awaiting response.

I have also done it this way with State wide services. I have even set up "route systems" where by depending on what roads/highways I might use to travel from point A - B, I have programed the relevant service District etc, that would be covering the relevant section of my trip.

not to seem like a smart AS* but people move (relocate) I was born just
west of here about a hours ride but I have lived out of the state most of
my natural life so in essence I am not as up on what and where's as what
some of the native people might be so I just have to guess as to what needs
to be and I may be speaking for others as well that is why we ask questions
since the radio is new as well.
I guess what I was asking was how do you get the rest of the TGID's into
the radio if it only excepts 20? it isn't like it has banks like the GRE
radio's.

It accepts much more than 20 TGIDs for each system. I forget the number off hand as I have been in 436/536 mode and haven't reprogrammed the 396's or 996's in a while. However I have a large 147 site 2500+ talk group system programmed in both the 396's and 996's by breaking the system down to zones just as the statewide system is. Its further broken down by service. So one system has all the police in the central zone along with all the sites in that zone. Another has all the fire in central zone. Another has all the police for the north zone and another the fire for north zone and so on.
If you use FreeScan you can check to see what the breakdown is for the whole scanner such as number of systems, channels and so forth.
I also have the entire states conventional channels by each county, all 92 counties. That way when I travel I can hear it all using the GPS to select the active channels and systems and sites as I drive. It works very well.
All total, with all the statewide system, all the conventional by county and several local area systems programmed in there are over 14,000 channels programmed. Of course depending on location only a small fraction are actually scanning at one time.
At home its only scanning 15 sites on the statewide system of 40 some sites in the central zone, plus 20 county conventional systems, and 5 other trunked systems.
So there is plenty of room for TGID's. You just need to figure out how to set it up properly to get it all to fit!

20 Groups, not 20 TGIDs.

Apparently, the 536hp software is for both, which is not surprising as they are almost identical..

Just got my 436 today, so will be playing with it J

I believe those of us who pre-ordered were given the opportunity to beta-test the 536HP ARC software. I cannot speak to the 436HP as I did not order it.

On my previous Uniden scanners I use Scancat Gold which I found to be far superior to Butel's product, but they seem to have stopped any further scanner software development. What shame.

I liked XP too and it took some time to get used to 7, but I like it a lot better now. I have 8 on my touch screen computer and it has some advantages over 7, but if I didn't have a touch screen, I'd never use 8.

Every time MS fixes something it seems like they break two other things.

I agree 100%. I too have a Win 98 laptop that I use for my older scanners. If it ain't broke don't fix it. My opinion is that newer OS's are designed for morons and the general trend of a dumbed down society. Every newer version is made more idiot proof but at the same time isolating power users from access to lower level operations and control. There are still a half billion XP machines out there working perfectly. Many of them owned by businesses hanging on by a thread who can't afford to upgrade their entire systems for the sake of being a fashion victim. MS is in the business of making money and the only way they can continue to do that is to force the obsolescence of earlier OS's. Personally I think it's dishonest.

From: Michael Hopkins
Topic: 8851 Message: 8877

A bit off topic, but let’s be realistic. XP will likely be around for a long time to come even if Microsoft doesn’t do any more updates or provide support. Too many US corporations are still using XP for 2 reasons: It’s a very stable operating system in wide use and the cost for a company to upgrade massive numbers of computers to a new operating system (that may also be very stable) is prohibitive. Certainly there will be a slow movement towards the next generation as computers are replaced, but it will be relatively slow in my opinion.

Personally, Windows 7 upgrade from XP or Vista was a snap, but I had numerous problems getting all my programs to run on 8.1. That said, I’m quite happy with 8.1 but it was a couple of weeks of headaches to get everything working correctly.

My 2 cents…

There are two other sides to this that I think are often overlooked.

From the business side, it takes an enormous amount of resources for any company to continue to support old products. Consider an automobile - eventually it goes out of warranty even though you can still drive it. If it breaks down, it's up to you to buy the parts and (possibly) pay someone to fix it. You have no expectation that the automaker is going to continue to send parts and technicians to adjust your car for free as it ages. The same is true of Microsoft and Windows. It continues to develop new versions of its product (Windows) and, yes, they do want you to pay to upgrade. Just like GM does when they release a new model year. That's how they stay in business.

There is also a responsibility to the community. Windows XP was developed in a much less hostile environment. That is, "security as a requirement" wasn't yet the priority that it is today. Newer versions of Windows have focused on that, and many of those features were 'back-supported' as updates to XP. After a while, it just isn't practical to continue to do that. As a result, new exploits against XP will continue to be discovered and all those un-upgraded and no-longer-patched machines become honeypots for malware.

PC's are like puppies - once you have one it is your responsibility to take care of it and to keep it behaving. If your XP PC is on the network, you are asking for trouble for yourself and the rest of us if you don't upgrade it.

FWIW. 73, and thanks for your time!

From: Michael Weidemeier
Topic: 8879 Message: 8879

Hi,
I must have pushed a wrong button. While it was scanning I pushed WX and tried to get a local NOAA station.My problem: While my scanner is scanning for local aircraft it gets locked on, "CC Found Press any Key." It interrupts normal scanning and sometimes I get FM radio stations.
If you could help I would greatly appreciate it.
Thanks, Mike

You activated Close Call (Function-Avoid). You can disable it using the same keys.

Hi guys! How are you?!

I'm trying to upload some PDFs about DIY USB cable to UNIDEN scanners for those who don't want to spend a lot of money buying the "official" cable or for those who want make your own cable just for fun.

I already create a folder and uploaded one PDF but when I try to upload the another file I got an error message.

So... Anyone knows what is going on? Is thera some kind of limitation to upload files to the group?

Thank you!

That's how it's set.
For some reason I am not getting any p25 at all.

FYI I'm near Indy and receive Hamilton county MARCS sites, even Butler. So unless you have something programmed or set wrong you should receive them fine.

I have the Butel ARC XT basic software for the BC 396 XT---2 issues looking for help.I am using the scanner on convential systems only. Sometimes a channel gets noisey and I press lockout---temporary lockout appears in the screen---after a few scans the channel is no longer locked out. How can I make the lockout stay until I am ready to unlock it?

Also there are some channels that don't need delays---Is there a setting some where in the software or on the scanner front where I can disable the delay on particular channels?

In the software change delay on a per channel basis.

Temporary lockout is supposed to last until poweroff or manually changing it. Not sure what is going on there

Press the Lockout button a second time, it cycles between unlocked, to temp lock, to perm lock.

It's probably Linn County, Iowa, as stated in the subject of the original post.

The OP didn't say if he was having trouble hearing anything on the conventional VHF frequencies or the Linn County, Iowa, Public Safety P25 system. Maybe county has recently switched over to the P25 system and the OP is still listening to the VHF freqs.

Also, in looking at the Linn County, Iowa, Public Safety P25 system in the RadioReference.com database, it appears that several talkgroups were recently changed so that may have changed what the OP can hear. It also appears that several talkgroups are now encrypted which will make it impossible to monitor them.

The city, county and state also need to be in the actual message, along with other things like systems and services people want help with.
In this case the Iowa was easy to miss on my phone and since it wasn't in the message anywhere I missed it. Honestly I rarely read the subject line and only read the message, especially when using my phone.

John - sorry for the inconvenience for you.

Bob - this is for the new Linn County (IOWA) Harris P25 simulcast system. It's the only system Linn County (IOWA) has. I get no audio so I think I have some setting wrong. Since it is simulcast, I thought originally that the audio problem was because I was near a tower but I hear nothing regardless of where I am. Well aware of the encryption but I hear nothing at all - even with IDs programmed and doing ID search. I'm stumped!

Was hoping there may be someone in this group from the Linn County (IOWA) area who may have it figured out and could share their .rsf file. Anyone?

8913. Linn County Iowa P25 System

Yahoo group: BCD396XT (2011 — 2014)

From: RJH
Topic: 8913 Message: 8913

Hi,

Seeing we have been talking about this for a week or more: I don't think anyone on the list can help you. There might be an Iowa list on yahoo and someone may be able to help you there or contact local users through Radio Reference.

This list has people from all over and few from Iowa I would guess.

If I lived in your area I would come over or have you bring the radio to me. I have done this for people in my area, it's usually something simple like a wrong frequency or software setting.

There should be someone in the Cedar Rapids area to help you but contacting the list where most people are not from this area probably is fruitless. Pick someone on the list if you have to and send them all the information you have, screen shots of your settings maybe Skype the scanner itself to show what you are seeing when scanning.

Please don't subject the whole this to all this.

Good luck

Ray

John - sorry for the inconvenience for you.

Bob - this is for the new Linn County (IOWA) Harris P25 simulcast system. It's the only system Linn County (IOWA) has. I get no audio so I think I have some setting wrong. Since it is simulcast, I thought originally that the audio problem was because I was near a tower but I hear nothing regardless of where I am. Well aware of the encryption but I hear nothing at all - even with IDs programmed and doing ID search. I'm stumped!

Was hoping there may be someone in this group from the Linn County (IOWA) area who may have it figured out and could share their .rsf file. Anyone?

When you say "Harris P25", is it a Harris Open Sky system? If so, no one
can help you because such systems cannot be monitored.

I have no first-hand knowledge of that system. I am just reacting to the
name "Harris" in your post.

i finaly got a tone out signal and incorporated it and I cant seem to get it to work the a is 2793.8 b is 2790 its set on nfm and the att is on I leave it on standby (8) but when the tone out comes on the scanner dosnt trigger on I also have a 106 and 346 xt I use to see when the tones are used while my 396 is in standby mode but I cant seem to get my 396 to trigger on, any ideas also im using a rs 800 MHz antenna should I use the stock?

First, that will likely never work. You either got a bad search decode or bad info since those are virtually the same tone. That happens a lot on marginal signals or simulcast systems.

If you have a group tone of 2807.0 (which is the closest standard tone - Plectron P35), program only the first tone (a) for a 4-second tone or program only the second tone (b) for that tone. In either case program the other tone to 0 Hz

I suspect your info or decode was bad, though. You might even be hearing a tone remote console tone which is not used for paging.

The b tone only is for an 8-second group page. Forgot to mention that.

It is likely that these were false hits. I occasionally get high tones in this range due to voice or background noise.

Even if this was a real hit, it would have likely been a "long tone" which is a single tone sent for a longer period. These are often used for group calls in which several pager groups with a common "A" or "B" tone or a common separate "C" tone are called. Since the tones you decoded are only a few Hz. apart they are within the radios margin of error. (The MofE increases the higher the tones are BTW.)

I would do the following to increase your likelihood of decoding actual tones:

1) Turn off the Attenuator
2) Use an antenna tuned to the frequency range of your target. If you don't have one set to that band then use the stock antenna.
3) Use "FM" modulation instead of NFM. This usually increases the accuracy of the tone out feature.
4) Set the tone out frequencies to "0.0" for both the "A" and "B" tones, this sets your XT radio to Tone Out Search.
4) Make sure that they are actually using a 2-Tone system. (Do you hear a set of tones or a long single tone?)
5) If they are using a trunked system then forget about Tone-Out mode, they are not compatible.

If you use Virtual Control software then look for the logging feature when using Virtual Control. This will show you the approximate tones used even when you are not around the radio. I know ARC-XT has this, I assume other programs do as well.

Remember that tones displayed by Tone Out Search, either on the radio or in a program's log file, are approximate. They are often off by a Hertz. or two. This is usually not an issue, most systems have a pretty wide margin of error. a tone set displayed as 800.0/1200.0 is just as good as 798.4/1203.2...

I have a list of actual tones used by most paging systems, it may be in the Files Section here, if not let me know and I will post it up. You can use that to try and figure out the actual exact tones used but remember that close enough works in FTO mode.

Unless your close and getting full strength signal you should not use the ATTN which is possibly giving you bad decode and improper tone decode.

Thanks. That helped confirm my thoughts.

The MA State Police system (http://www.radioreference.com/apps/db/?sid=736) should be programmed as Motorola Type II, not P25. This system is type II, but has analog and P25 audio.

Hope that helps.

Frank

Frank

They have a new system P25 that according to Radio Reference they are using it in the western part of the state. The city of Cambridge is also recorded as using the P25.

I forgot to tell you I am using Butel 396 Pro Not sure that matters

John

John --- I listen to MA State all the time, but most of it is NOT a P25 system. Most troops are still using the standard (re-banded) trunked system; Troop B is supposed to be a P25 system, but I sometimes hear Troop B on the standard MA wide channel… Let me know if you need help programming them…. I had a lot of trouble getting it right first time around.

I have the unitrunker and it works awesome with the 396xt only thing is when the toneouts come on either from fire or ems it stops working it wont show their radio id I have to hit the start button every time the tone comes on it seems to stop the signal anyone know why(its usualy blank so im guessing tone outs don't have radio ids just the talkysystem 00207 etc but given that possibility why does it shut down still)

8936. Here's the scoop

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-02-26 13:23:04 UTC
From: RJH
Topic: 8936 Message: 8936

Hi,

I have already communicated with John off the list. First, I believe he has a 396T, unless I am mistaken. So. Why are we discussing this on a 396XT list?

Secondly, I sent John Butel 396 files for both systems, I don't know why with software dominated programming there aren't more system files on all of these lists.

Thirdly, I am sure you mean well Mike, but my guess is: he would like an answer sooner than a few months.

Finally this is the scoop: there are two MA State Police Systems the Analog Multi Site System which still has most of the traffic, including Troop B out in the western part of the state and the new P25 System. The new P25 System was started out west but has moved east. It is using 700 Mhz frequencies for the east channels. Some of the departments in the east include Boston, Cambridge, BAPERN, Troop A, B, C, D, E , F and H.

If anyone else has more information please let us know. I have placed my files up there on the Yahoo list in Scan Control, Proscan and Butel formats.

Ray

This is not completely accurate. The 700 Mhz overlay system for the greater Boston area is still being built out. To my knowledge no agency is actually operating on it. Cambridge is primarily on their own P25 system, with talk groups on the state system for when units move out of range of the Cambridge system. The City of Boston and the MSP share use of "Zone 1", with most city services operating there. Boston FD also has some talk groups there, but not of fire operations. MassPort, which runs Logan Airport among other things, just moved over to their P25 system. Troop F operates on that system, but their primary talk group is simulcast on Zone 1 as well.

BAPERN isn't a department, it's a interoperability system. The member agencies operate on UHF and the primary interop channels are on UHF. Agencies on 800 trunk systems have talk groups that tie in to those channels.

I think we'll see more active operations on the 700Mhz overlay, but not for a bit. I keep that on search to see what new talk groups are popping up.

As a general rule, the digital TGs are the analog TG divided by 16.

So, H Patrol 1, which is 33264 on the analog system can be heard as 2079 on the 700 Mhz P25 system.

,

Well, I have two systems in my scanner the Analog System and the P25 System On the P25 System I have heard Troop A, B, E, H, and F. I don't know which talk groups as each has several. Additionally, I have heard BAPERN, Cambridge Police, Cambridge Fire and Boston Fire on the P25 talkgroups, I didn't really note which Talk Groups as I don't care. There was traffic on those talk groups on the P25 System.

It may be cross patched but there is traffic on some of those P25 talk groups. Yes you do have to be inside a major circumferential highway (128) to hear the traffic. I live in Central MA and can hear the Troop B P25 traffic not the Metro from here only inside of Route 128.

Again, the majority of MSP and ancillary agencies are still on the analog system.

Yes, BAPERN (Boston Area Police Emergency Network) started in 1978, Chief Quinn, Tim Coogan, Newton police. Gary knows about this I didn't want to bore the 90% of the list members who this means nothing to, as they don't live in this area.

It sounds like John has it all figured out now John do you have a 396T or XT? This is the XT list.

Any reason why list members on all lists cannot send system files?

Thanks,
Ray

Why do you INSIST on being the list police?

There are similarities between the "T" series all the way up to the new "x36" series. Yes, there are difference between them as well, but the dynamic memory structure is similar enough that owners of one model can be a great help to owners of other models as long as they keep the limitation of the older models in mind.

Would you like it if another member of the list told you where to go???

Dewey

I'm about to purchase a new 396XT. I've watched the various YouTube videos on programming and I've followed the problems addressed in this blog. I live in a major metro area (Atlanta) where all of local police and rescue use trunked systems and some have moved to the P25 standard.

My question is, how difficult is it to program a 396? My thought is after figuring out how to program my Baofeng hand-held Ham radios everything else is gravy.

Tom

Hi Tom,
I use Freescan to program XT's.
http://scannow.org/site/sixspotsoftware/products/freescan.html
Once you understand the software's personality it becomes quite easy. You can copy-paste from radioreference.
There are other software options available. Each has it advantages/disadvantages. Once you decide on the software and learn how to use it, it's a piece of cake.

You need a paid sub to import directly from RR. Copy-n-paste is something anyone can do.

True. I was just commenting on the facts presented. Of course, maybe Bdad's browser doesn't support the copy function, in which case he would be correct for that browser.

8953. Sorry Dewey and difficult to program

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-02-28 12:20:07 UTC
From: RJH
Topic: 8953 Message: 8953

Hi Dewey,

Maybe you have a point but it just helps if people keep topics to each list and update subject lines. You know Dewey, I may complain but I also try to help. I don't have a 396 XT but I do have a 396T and posted files for my radio in three formats which people have said was helpful.

Have you posted any files up there Dewey?

Additionally I have tried to help people in my area with any 396T or Home Patrol issues.

Tom, as for programming for some it's easy for most it appears to be difficult. Unfortunately, you get a lot of flip answers here because it's easy for one person or a particular software works for them and they think it will be easy for you. Get a local person there, to work with you and you will make it easier for yourself and save a lot of back and forth traffic on the list.

Sadly, being a Ham may not exempt you from obscurity. We have had a few radio experts here who became hopelessly lost with scanners.

Feel free to contact me direct, I will help if I can.

Ray

From: Den
Topic: 8940 Message: 8954

I am a paid subscriber to RR and also use ARC PRO and have no problems. If you can afford a new 396XT, you can afford RR and or ARC, my opinion.
Freescan is fine as well and I play around with Freescan but I prefer the ARC Pro since I have used ARC from the beginning when Butel first starting offering it.
Now you have to get it through Scanner Master.

Dennis

Schuylkill County will be switching to APCO project 25 in the future.With the Butel basic do I just program (through the drop box) their channels for DIGITAL? Is there anything else that has to be done?

Also how do I enable/disable close call?

If it's conventional P25, yes. If it's trunked, it must be programmed as trunked.

Function-HOLD to toggle Close Call. It will toggle through Pri, DND, and OFF.

8961. Noise coming from radio

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-03-11 22:24:25 UTC
From: red2965 .
Topic: 8961 Message: 8961

is it just the radio system (MOSWIN) or what, I noticed it after I got a car adapter and a new stereo for the vehicle that has a stereo jack input for my audio.
It sounds like something is frying (Hissing sound) when it breaks squelch and while it is open?
really quite annoying to say the least.

From: Jeffry Rehm
Topic: 8961 Message: 8962

Could be the car adapter. Try unplugging it while using the scanner or car radio and see if it stops. I bought a car adapter to usb plug for my car and as soon as you plug it in my AM radio reception turns to complete buzzing. Just a hint.

Subject: [BCD396XT] Noise coming from radio

is it just the radio system (MOSWIN) or what, I noticed it after I got a car adapter and a new stereo for the vehicle that has a stereo jack input for my audio.
It sounds like something is frying (Hissing sound) when it breaks squelch and while it is open?
really quite annoying to say the least.-- Mark ~

Try different combinations of low receiver audio turning up the stereo and higher receiver audio keeping the stereo volume low and see what happens. The 396xt may be overdriving the stereo amp.

Could be the car adapter. Try unplugging it while using the scanner or car radio and see if it stops. I bought a car adapter to usb plug for my car and as soon as you plug it in my AM radio reception turns to complete buzzing. Just a hint.

Here is the results and I guess I should have figured.

I tried
without the car adapter just the stereo connection sounds fine
With the car adapter and stereo sounds fine
now I start the vehicle.... whoa there it is. picking up electrical pulses
I assume from the charging system.
in the day I would have to put a resonator on it with this new fangled
gadgetry these newer vehicles come with, I don't want to ruin anything and
I would have to but it as well.
thanks for the ideas.

If you have it plugged into power you will get the hissing noise. I have it charged and then there are no issues.

What is the power source? Maybe it's generating the noise.

You probably have a ground loop. I had the same thing happen in my car when I used anything that plugged into the auxiliary input on the radio (CD players, the 396, etc.) The ground loop acts as a giant loop antenna and picks up all the LF noises in the car (fuel injectors, spark system, alternator whine, etc.)

The thing to try is to break the ground loop. You can do it one of two ways. First is to get an inexpensive audio patch cord to go between the 396 and the stereo. Cut the shield of this patch cord (that's why it's a spare cheap cord) so there's no continuity through the shield from one end of the cable to the other (the sleeves on tip-ring-sleeve plugs). The inner audio paths (tip and ring) should stay intact. If the ground loop is the problem, your noise should go away entirely. You can later replace the cut wire with a ground loop isolator (many electronics stores have them).

Here is a few of the answers to your questions.
I found the cheapest car adapter I could find on eBay, I think I paid roughly $9 and some change for it with the s/h. I noticed it has a 6.5v output @ 1.5 amps made in china of course and I was subject of it. but agcme2002
put the thought of a ground loop issue and lord knows I have one starting from the battery I just recently tried to replace it with after-market cables as MOpar is damn proud of all their merchandise I felt it was cheaper to go that way... but, I still spent $30 at O'Reilly Auto Parts for a heavy ground cord and 2 short 10awg wires...I know where the main cable goes but where in Carmen does the smaller ones run to? on the net it said one goes to the A pillar I assume to the dash gauges, heater and such....when I slow down to a stop my headlamps dim and my heater takes a quick dive in speed for a split second. when I get a chance and the weather is nice, I will put a sound generator on them (ground wires) and search them out. no garage..LOL
Thanks to all for the extra ideas.

The "A" pillar is the windshield side pillar that connects the firewall and the roof. The chassis, box frame, engine block, hood and trunk are all "bonded" together, typically by short lengths of copper braid that is attached by self tapping screws and toothed washers.

On a lot of vehicles its best and sometimes easiest to just run a new plug. Many of the vehicles though have specific places you can connect radios. You don't mention the year and model so its hard to tell you where the wires your looking at may go or give you ideas that may help.
You do mention MOPAR but that covers a lot of vehicles and years! On my Dodge Ram 2500 there are all kinds of computers and possibilities for interference. Switching stereos in it I had to go with a different location for the +12v as the stock location had noise. Turns out the factory stereo was made with a filter so it wasn't noticeable. Any one of the numerous computers as well as the alternator can introduce noise.
One of the two power plugs has noise in it, and I traced it back to the main computer which BTW also has the voltage regulator in it.

Sounds like a bad alternator and/or battery. Either could cause noise on the electrical system.

Oh, and the cheap adapter likely exacerbates the electrical noise. While I to like to save money, I'm not sure I would trust a cheap adapter to power a $500 scanner. I had a cheap fm transmitter / power adapter for an old iPhone take out the iPhone. Fortunately, it was an old one I just used as an iPod for the car.

Doesn't have to be a bad alternator to cause noise. Some do it "naturally"

True, but they shouldn't make the headlights dim or heater slow.

Depending on the vehicle, which he didn't specify even dimming lights and blower slowing can be normal, especially on certain model Chrysler products and Jeeps. Jeeps are notorious for this as they use small guage wire for the lights and alternator. I have rewired them with heavier wiring and fixed the problem. Its a lot of work and not cheap.

Well, the ground loop I'm referring to isn't really the battery cables (though that's a small part). The loop itself is the loop from the car chassis (where your 396 power cord gets its ground connection), up through the 396's power cord, out the audio jack (shield), into the stereo, and then back to the car chassis. That is the loop you really need to break which is why I suggested starting with a cheap cord that you can cut the shield. If the noise is gone you solved the ground loop problem for the 396 and you can buy yourself a ground isolator for the audio cable.

8979. P25 phase 2 operation?

Check prior messages...
But quick answer NO, never...
It takes a different VOCODER and more CPU power than the 396 has.

Hi,

If I remember correctly from previous posts on the topic, the 396XT / 996XT can't be upgraded to P25 phase 2 via firmware.
To my knowledge, P25 phase 1 is FDMA type whereas P25 phase 2 is TDMA type, two completely different beasts not addressable via firmware only.

'Hope this helps!

Wow, sorry for being away so long....
It is a 2002 Dodge Grand Caravan Sport had a 3.3l v-6 FFI in it when I bought it and a year ago I had a junkyard put another one in it and I don't see flex fuel on the intake anymore so be that as it may I did have a bad battery in it at one point and that caused a lot of my ground cable problems, the acid litterly ate them up! I kept stripping on one leading back to the firewall and never did find any real wire it was brittle and extremely oxidized just gave up till later and butted the two together.
While a bad battery can cause alot of problems by itself I have never heard of a battery by itself causing ground problems....I have a scangauge II and I know that my alternator is good. it averages 13v ~ 15v constantly. and like I said All my ground wires were and really still are ate up with corrosion the only one I feel comfortable with is the big one leading from the battery (-) to the starter as being sufficient the others are suspectable.
Hence, my dimming headlights and heater dipping issue I am pretty sure since the ground is floating, until I can get to it I have degenerative hip damage and it hurts like hell just to get to work and the 40 mile round trip really adds to it.
I have I guess always been a mopar person and I thought most had almost a unibody kind of like the AMC's do so that in itself seems to me like ought to be a ground point.
anyway sorry to be so long winded.
Oh, before i forget it I am sure that cheap adapter doesn't help but what with spending $525 for a two year warranty and the radio itself and another $60 for the cable to turn the one they provide into a usb at the shack I am badly bent.

Although many people call Phase I FDMA, there is only a single transmission on the carrier. There are not multiple transmissions (no MA at all - just a single user at a time).

Phase II is TDMA.

$60 for a serial-USB adapter? Ouch! That's one thing I have purchased for a couple bucks on eBay. Anyway, yes, a bad battery ground cable can cause a voltage drop, too, but usually not just when the engine RPM drops. Well, I guess it could if the alternator is supplying most of the power and the absence of that source can't be made up by the battery due to the cable's lack of capacity. It's really not good to run a vehicle like that, and you likely have a ton of AC on your system since the battery also acts as a capacitor that smooths out the ripple. Your cable also may be getting really hot due to the resistance and could potentially cause a fire. In short, fix tat electrical system and your issues should disappear.

OK, well the vans are one of those vehicles that has issues. Just like Jeeps the wires used for things like the lights are not heavy enough gauge. Even under the best of conditions the lights can dim.
One of the biggest issues though is the battery to engine block ground. That connection at the block gets corroded and needs yearly cleaning. Usually I remove the cable from the engine and wire brush it then put it back together and out grease over it. I use expensive waterproof grease so it doesn't wash off.
Also on those vans they tend to run the cable to the alternator bracket instead of the actual block, I move it to the block with a longer cable. Putting it on the alternator bracket can introduce unwanted noise as well.

The loop itself is the loop from the car chassis (where your 396 power cord gets its ground connection), up through the 396's power cord, out the audio jack (shield), into the stereo, and then back to the car chassis. That is the loop you really need to break which is why I suggested starting with a cheap cord that you can cut the shield. If the noise is gone you solved the ground loop problem for the 396 and you can buy yourself a ground isolator for the audio cable.

Under normal circumstances it wouldn't matter, but adding scanners or ham radio/CB the cable being mounted next to the alternator injects noise that's unwanted.

Download an updated driver. Do a search of the archives. Those two things should get you running.

Unless you have latest USB-1 cable with the HXD? chipset I would use version 1.7of the driver. I always had issues getting version 1.8 or 1.9 to work with the HXA? Chipset

Hi group,
I just recently bought a BCD369XT along with the software. I am having issues programing it for my area, Sacramento, CA.
I was wondering there was any other BCD369XT users in the area that would be willing to meet up with me and assist me in programing my radio?

We do not have this in our area so I am not familiar with it, but, based on what they are saying in the 436 group, it is compatible with Phase 1 and Phase 2. Go to 'BCD436HP@yahoogroups.com' for more accurate info.

If you are asking about phase 1, yes. The new ones also get phase 2. A local city near me is using phase 2 and I receive them just fine. (Except they encrypted the police channels. It doesn't matter what type of system is being used if they decide to encrypt, you can hear the transmissions but they are garbled or scrambled, meaning encrypted. And of course, any intentionally encrypted system is protected from unauthorized attempts to decrypt them by law. If someone is caught, they face prosecution which can be very expensive and include jail time.)

My friend, this are encrypted transmissions. If you are is São Paulo, forget to listen something. Does not worth have a APCO25 Scanner in Brazil.
What you listen eventually are transitions that the encrypted was turned off.
Remember that is ilegal to listen safety or government agencies transmissions in Brazil.

Meu amigo, isso são transmissões criptografadas.
Se você está em São Paulo, esqueça de escutar algo. Não compensa ter um scanner APCO25 no Brasil.
O que você escuta eventualmente são transmissões que a criptografia foi desativada temporariamente por algum motivo, geralmente por problema de recepção, mas logo eles irão ativar novamente.
Lembre que é ilegal ouvir transmissões da polícia.
Hoje todas as transmissões estão migrando para a DIGITAL por determinação da ANATEL, principalmente Motorola MOTOTRBO, não existe scanner para ouvir esse tipo de transmissão, ou seja, o scanner está quase inútil por aqui.
Qualquer dúvida me manda um e-mail.
Abraços.

Eu também pensava assim, mas de fato ouço em P25 o COPOM se mudo a frequência ouço as viaturas, mas não no mesmo canal. Tenho outros rádios mas é o primeiro digital e nem esperava isso. Consegui uma configuração onde vejo o ID de todos, mas ouço apenas a central. A verdade é que esta me faltando inteligencia para configurar esse radio. O pessoal da PM que cuida das configurações dos Motorola XTS 4250 só sabem configurar o radio deles, não conseguiram configurar o meu. Não sei se esse radio é permitido no Brasil, mas a radio escuta é legal desde que não sejam divulgadas as informações ou ouvidas em alto volume em praça publica.

Yeah I haven't touched up on my Portuguese in a while and the Spanish that I know doesn't cross over to enough of that to comprendé. Sounds like he or someone has a nice Motorola rig though and maybe something about how it's legal to monitor their comm's as long as they don't divulge the contents of the info to the public...but I'm going off of some really old Spanish classes and guessing on the Portuguese translation--didn't feel like plugging all that into Google Translate and I sure don't have Rosetta Stone :)

9005. Communicating with the BCD396XT

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-05-07 13:42:47 UTC
From: <snivvy@...>
Topic: 9005 Message: 9005

Hi! Has anybody communicated with the radio using a terminal program? What I am looking to do is to use the native commands to communicate with and 'remote control' the radio. Just a few features, not a complete remote control system like Butel provides.

Thanks!

Bob

I haven't. Is there a way to get it to scan through everything at once? Mine goes by alphabet like A through C and then does the rest seperately (we have a lot of frequencies in Los Angeles) Thanks
Tom

9012. Loose charging port

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-05-12 15:09:29 UTC
From: Shawn Kurschner
Topic: 9012 Message: 9012

My scanner was plugged in, charging. It got knocked off of my desk. The cord stopped it in mid-air. Now, when I plug it in, it doesn't charge. If I push the charger tip up and to the right, it charges. Obviously something is loose. The scanner is out of warranty. Is there a part that I can replace or should I just send this into Uniden to have that charging port replaced? Thoughts?

Send it in. Really doubt if there's any user serviceable parts in it. Same type of thing happened to my old 296 and I just sent it in and Uniden put a new board in or whatever it is they do. Was worth it.

Regards.

Absolutely. I used a terminal program when I was writing code to control my scanner using an Arduino. I've used TeraTerm but basically any serial terminal app will do. Make sure you match the baud rate to the one set on your scanner.

Dude, you say "absolutely", but then give no clue to how.

I think that was the gist of the question.

You explained nothing to the OP. Nova, puTTY, whatever. I haven't tried, so I don't know, but please don't tease someone and say that you've done it without explaining how. There was a reason the question was asked. All you said that it could be done. Neat. What if you asked if you could traffic shape your Genudocom 3500XL router, and I said "absolutely"?

That's all.

Non-contribution.

I would kick myself.

Hello,
Does anyone know which firmware is the best for this scanner?
I am running 1.08
Does 1.10 improve p25 monitoring? do the individual settings for p25 help a lot?
Also I have heard it's best to stay away from version 1.11 because of problems.
Any help is appreciated.

Thank You
Van

Hi,

The latest firmware works fine.

It’s too bad Tom you spent all that money for programming. There are plenty of people here who would have done it for free.

Ray

Wed May 28, 2014 4:18 pm (PDT) . Posted by:

<mailto:vanguardbg@...?subject=Re%3A%20396xt%20firmware> vanguardbg

Hello,
Does anyone know which firmware is the best for this scanner?
I am running 1.08
Does 1.10 improve p25 monitoring? do the individual settings for p25 help a lot?
Also I have heard it's best to stay away from version 1.11 because of problems.
Any help is appreciated.

Thank You
Van

No problems here with 1.11 and I use it on a number of systems. Also use it on trips
without any issues.

i've removed every reference i can find for anything to do with 'priority' and yet my scanner leaves an active channel every 2 seconds and i lose 1-3 seconds of audio. had a medical emergency a block from my house and of course the address cut out! i had to use my $40 chinese radio instead of my $400 bearcat because the damm bearcat went somewhere every couple of seconds.

i just had to program a neighbors old pro-94 and was astounded at how much my bearcat missed compared to that 10 year old ratshack model.

does close call cause this? i do keep cc on all the time.

and on the subject of close call, i've owned these radios for 7-8 years and bought every manual available for it and i still cannot figure out the paradigm. sometimes it works exactly like i expect and i immediately hear cc transmissions. but mostly it says, 'hit <function> key' and hitting the <function> key does absolutely nothing but return it to scanning.

i've tried the option of 'recording' the close call hits but then i can't find the hits. i need every close call hit to give me immediately audio on the hit channel. is this possible? if so, what options do i need to set.

thanks! /guy (73 de kg5vt | wqpz784)

Yes, close call has to sample the spectrum to work. It should be about every 5 seconds or so.

Wasn't there something with the weather settings that could confuse the issue also? Something like the following... you know there is a priority scan feature turned on due to the scanner audio being interrupted every 2 seconds... and you check all the priority instructions to no avail. But there was a weather priority setting that wasn't quite as obvious?

yeah, i'll bet wx would cause this too but there's a wx icon that should cue you, right?

anyway, many thanks for all the responses and the solution. but does anyone have any thoughts on the 2nd question i snuck in about how to set up close call so you can hear the hit instead of it asking you to go press a key?

and i remember something about it storing cc hits in a special bank but i've forgotten how to get to this bank. and i think i disabled this feature because cc would also scan this bank and i didn't want that. but i can find this in the ezguide, it's how cc handles hits that is confounding me.

i'd be happy is there was some mode where i could hear the hits in real time as i can't ever get to the <function> or <enter> key before the hit is gone.

thanks! /guy (73 de kg5vt | wqpz784)

You will hear the hit - you just won't see the frequency displayed. If this is what you are asking about, I don't think Uniden can show it automatically due to patent issues.

tks joe, but some small percentage i'll hear just a second or two of, but most of the say 'hit function key for ?something?' but in every case hitting the function key does nothing except return it to scanning. and i do see the frequency displayed in all the cases where i hear audio, but either it isn't in the <function key> msg or that msg erases it.

Is it asking yo Auto Store? If so it is saving the hits in a file called Auto Save. Scroll through the systems and you will see Auto Save in those where they were saved.
For hits with no audio it may be because it just missed the transmission or it was some sort of data or a hundred other reasons.

Close call hits.
To see who is talking I press the (.) no Key.
If you press the Hold Key it shows who is talking and holds it till you release it by either Hold or Store it with the (E yes) Key.

i've changed close call to /dnd/ mode, i've turned off priority and made sure that none of my channels are labeled as /pri/ even though shutting off the function should do it. afaik i don't have any wx modes set to alert. i even went into the scanner config and changed the battery save from /2/ to /5/ although i'm not certain what the difference is.

and i can go into weather mode and listen to an noaa channel and it's solid--signal doesn't go away. but when i'm scanning and land on a hit the radio will drop out 1-2 seconds of the audio every 2-5 seconds. apparently it's 'going somewhere else' to service some other function, but i'm at a loss as to what that would be.

i'm reviewing this thread now to see if someone suggested something i've missed along the way.

thanks! /guy (73 de kg5vt | wqpz784)

Does anybody out there scan the San Diego County Sheriff frequencies on the SD County RCS system? I have for many years, mainly scanning the Encinitas Dispatch (34000), Vista Dispatch (35040) and San Marcos Dispatch (34672) groups. After a month or two of being away from my scanner, I return to find only the San Marcos Dispatch still active, and no activity from Coastal (2x) or Vista/Fallbrook (3x) patrol units. Just alot of San Marcos/Inland (9x) units. What happened? RR shows no changes to the SD County RCS TGs or control frequencies. HELP!

Eric-

I meant to send a message Sunday morning, but being Father's
Day, had a bunch of running around and visit's to make! :)

I monitor the total opposite of you because I'm in El Cajon, so
I'm listening to East and South County SDSO stuff.

But, I did go on my walk first thing Sunday morning, and around
6:30am, a dispatcher came up on LAW CC and stated that all
systems are up, restored, and running.

Maybe you could double check and see if you everything at your
end is up and running again.

-Greg :)

Hmm...I'll check tomorrow (Tuesday), but I'm not optimistic. Thanks
for the reply.

There have been many times where Encinitas has been patched to Poway and Rural. If you using the 396xt it should be following the patches, but you have the 396t that does not follow the patches and you would have to have everything programmed in. I have recently been listening to all the SO dispatches and have had no problem monitoring any of them.

Odd thing: I added Rural (Poway was already entered) and there was
no change. Then under locked-out IDs I notice that Poway was locked-out.
I unlocked Poway, but no change. Scanner reports no locked IDs. For grins,
I go to the next menu to "unlock ALL IDs" (even though none were listed
as locked out.) BINGO! Now Encinitas Dispatch (with 2x units), Vista
Dispatch (with 3x units), and Poway Dispatch (with 6x units) are lighting
up.

So, I guess unlocking all of those "unlocked" TGIDs did the trick! ;)

You may need to enter all of the SDSO dispatch channels. I am listening on Poway Dispatch right now and hear Encinitas units. When the SDSO patches dispatch channels the main channel which gets used depends on which dispatch console is being used.

9050. Cable drivers not working on Windows 8.1

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-06-20 17:29:09 UTC
From: USLevi
Topic: 9050 Message: 9050

I finally decided to order a new cable to connect the scanner to my computer running Windows 8.1 with the HXD chipset.

The old HXA chipset worked for some time at the old driver level, but something got updated and maybe by error, I accepted the Prolific driver update. Now I can't get rid of the hidden update files and go back to the old rev level.

Ordered the cable from Amazon so will see if it works with Windows 8.1. Sure am lost with the computer update ability.

No, Joe I tried that last night and this morning. Somewhere, when you let your computer apply an update, it is stored so that if you ever reinstall that software, it automatically applies the update again. That is a good policy, except when you want to get around it.

The update was added in February so it is no longer removable on Windows Update.

I have removed the device driver numerous times, even went into the registry and deleted all the occurrences of ser2PL64.sys, rebooted, used registry cleaner, etc. The only way to fix this I believe is to reinstall windows and all the other programs. Too much work. I will try the new cable.

The old cable has a PL2303HXA chipset and the new cable has a PL2303HXD which is supposed to work in Windows 8.1. It is a known error that the old cable will not work with the new updates.

TMI, I know.

When I updated to the new driver, it did not work. I then uninstalled the driver, and reinstalled the old one. No problem, except, every once in a while the system tells me there is an update, would I like it installed. I say no. I have had no problems with using the older driver. One thing, that make a difference, I went into Windows Update, and turned off the automatic download and install. I set it to download, then tell me about it, I can then decide whether to install the update or not. This way, Windows Update cannot wipe out a desired driver, or patch.

You should not have to reinstall Windows to get rid of a driver.

Lets see how Windows sees the cable and maybe we can find the right driver.

Go into Device manager either thru Control Panel or by running devmgmt.msc and find your cable listed. Since it isn't working it should have a yellow exclamation point. Right-click on the device and choose Properties. In the next window choose Details. In the drop down under Property choose Hardware Ids. What I'm curious to see is the VID and PID values. For example, a USB to serial cable on my machine shows USB\VID_0557&PID_2088. We can look up these values to verify what manufacturer chipset is used. It might also be helpful if we had the currently loaded driver info. This is shown in the previous tab under Driver.

Rich

You can also try to roll back the driver. Go to Device manager, find and right click on your cable. Select 'Properties'. Select 'Driver'. If 'Rollback Driver' is not greyed out, select it. Select the oldest driver. DO NOT REBOOT. Your cable should work with the old driver, until you reboot or restart the computer, then the new driver will automatically load. You will need to do this EVERY TIME you try to use the old cable, so purchasing an updated cable is the easier choice. I now have an old cable that works fine with Windows 7, but not Windows 8.1, and a new cable that I use with Windows 8.1, but it doesn't like Windows 7. Go figure.

You can also try to roll back the driver. Go to Device manager, find and right click on your cable. Select 'Properties'. Select 'Driver'. If 'Rollback Driver' is not greyed out, select it. Select the oldest driver. DO NOT REBOOT. Your cable should work with the old driver, until you reboot or restart the computer, then the new driver will automatically load. You will need to do this EVERY TIME you try to use the old cable, so purchasing an updated cable is the easier choice. I now have an old cable that works fine with Windows 7, but not Windows 8.1, and a new cable that I use with Windows 8.1, but it doesn't like Windows 7. Go figure.

Hi,
I am unable to download or upload frequencies from radio reference using ARC-XT PRO.
I get serial port is not available or used by other software. Please advise how to fix.
Never had this problem before.

Thanks,
Mike

That doesn't make any sense since RR import uses the network connection, not serial.

D
Don't know if 8 is the same as 7 or XP, but you should be able to go into the Control Panel, Add/Remove Programs, and be able to see all of the installed Windows patches and updates. There you can uninstall any of them you want to. I had to do this with a particular security update that made all my Open Fonts disappear from my graphics programs.

Upload and download are ambiguous terms that rely of perspective. Maybe he wanted to use both to cover both bases. For example, when you program a scanner, you are uploading to the scanner and downloading from the PC at the same time from the PC point of view. From the scanner, you are downloading to the scanner and uploading from the PC.

The key for me was the (non-ambiguous) term 'from' RR. Besides, you can't send data to RR via a data file. So, I took it as getting info from RR which does not use a serial port.

That's why I absolutely HATE SW that has buttons tagged upload and download with no reference of perspective. Does it mean upload to the radio or upload to the PC? Read and Write are much more clear terms, and the direction should be specified in the tag, such as "Write to scanner".

9067. Fire Tone Out search.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-06-23 01:21:19 UTC
From: lists@...
Topic: 9067 Message: 9067

Hi all,

I'm still trying to get a handle on the whole process for FTO. Namely how to decode and what to do after I find them. I know what 2-tone sequential paging is and how it's used, but not how the 396xt and 996xt work with them. I've read the "Easier to understand" guide and the RR Wiki but that's only provided a scant few answers.

My local townships in NJ (they are not listed in the reference) dispatch on what they call their "municipal band" frequency of 158.94, PL 141.3. They tone out three fire departments in adjoining towns (West Caldwell, Caldwell and Roseland, as well as the West Essex First Aid Squad). So at very minimum, there are four sets of tones, and maybe more, sent on this RF Frequency. Two other towns use similar toneouts on their own RF frequencies for FD and EMS.

I see 10 Fire Toneouts available. Do I take this to mean that only 10 different departments or stations can ever be entered into the scanner or are there more somewhere? Or am I not understanding what to do with it??

So let's say I sit on 158.94, set tones A and B to 0.0Hz and modulation to AUTO (or NFM). The dispatchers send out tones for two of the three FDs and the EMS for a structure fire, let's say. Will the scanner search for and decode all three tones or only the first one it hears?

Then what? It decodes either one of the three (or all three). Where does it store them? Can I only monitor one of them at a time on only one RF frequency or can I set it to rotate through multiple RF frequencies that have toneouts on them?

Sorry if this is a bit rambling; I'm really trying to understand what this feature can (and can not) accomplish.

Thanks.

You are very close to understanding it. Yes, you can enter up to 10 tone sets of the same frequency and the scanner will alert on any or all of them. Yes, entering 0 Hz for the a and b tones will initiate tone search mode on which it will show the first tone set it hears. Make sure you set it for infinite delay or it will automatically clear the ton set. It does not store them anywhere.

OK, I think I got a handle on what it does when it receives correctly-set tones, but the real question is how do I go about identifying them. I had the scanner set to 0.0 / 0.0 and it found the first one. It flashed for about 15 seconds or so then disappeared. What do I do when they tone out two or three 2-tone groups in immediate succession?

The 15 second display can be fixed by setting the delay longer - such as infinite like I suggested previously. When there are multiple tone sets in succession, it depends on the policies of the dispatch center. Usually, they will dispatch the home station first - the one where the call is located. If they do that, the first tone set will be different and you can catch each one. The alternative is to set the delay short (1 second) and try to memorize each tone set.

Oh, and if they do tone out each department in the same order, you can let it decode the first set, then the next time reset it after the first set to get the second set. Then, reset the first two to get the third, etc.

Got the new cable today and it works with Windows 8.1. No problems and working at v1.9 Uniden download program with no problem.

New Hardwared IDs are:

USB/VID_067B&PID_2303&REV_0400

And

USB\VID_067B&PID_2303

$30 through Amazon to get back in operation.

Good day!

Lets see how Windows sees the cable and maybe we can find the right driver.

Go into Device manager either thru Control Panel or by running devmgmt.msc and find your cable listed. Since it isn't working it should have a yellow exclamation point. Right-click on the device and choose Properties. In the next window choose Details. In the drop down under Property choose Hardware Ids. What I'm curious to see is the VID and PID values. For example, a USB to serial cable on my machine shows USB\VID_0557&PID_2088. We can look up these values to verify what manufacturer chipset is used. It might also be helpful if we had the currently loaded driver info. This is shown in the previous tab under Driver.

Well, this past week has been an adventure in tone decoding, that's for sure. I set up on the regional fire channel and found far more tones being sent than I ever imagined. I think I got most of the important ones from their nightly tests but I'm still missing a few.

Usually they'll send the tones twice then the voice message, which does help a lot, but for the EMS squad they send two different groups in immediate succession.

Is there any software I can connect to the radio that will grab and write to memory every group received (and the time of the call)?

You can simply record the tones on a PC (or a HomePatrol model) and play them back over a cheap low power transmitter such as FRS or one I use - a 900 MHz wireless headset transmitter.

Perhaps you had an old(er than Windows 8) driver installed, and then upgraded your PC to Windows 8, you selected to download the microsoft update for the prolific driver, or perhaps you may be recalling the order of changes in the incorrect sequence. In any case, perhaps the following may help you:

Older Uniden cables (as well as other brands) that incorporate the older prolific chip sets (HXA and X) simply are not supported by the Windows 8/8.1 prolific drivers (see excerpt and page below)

The following is an excerpt from the page at:
http://www.prolific.com.tw/US/ShowProduct.aspx?p_id=225&pcid=41

"Windows 8/8.1 are NOT supported in PL-2303HXA and PL-2303X EOL chip versions. Run PL2303 CheckChipVersion tool program in Windows XP/Vista/7 to check chip version. Windows 98 and Windows ME driver support is discontinued and is no longer provided. Prolific recommends to use PL-2303HXD (HX Rev D) or PL2303TA chip."

If you perform the following steps, you should not have any issues:

- Verify that the chipset within your cable is the HXD or TA version.
- Remove any/all previously installed Prolific drivers
- Install the latest Prolific driver (from Prolific, not Microsoft) for Windows 8/8.1
- Verify the driver is configured for the desired COM port
- Verify the target port associated with the driver is configured for the intended speed, # of data bits, parity, # of stop bits and flow control.
- Reboot
- Open scanner application software

The combination of an older chipset (and driver) with Windows 8/8.1 should not have ever worked.

Hope that helps,
-Matt

Have enjoyed the BCD 396 until recently---the display "dims' to a point where u can barely see it---turning the unit off and back on--seems to fix it for awhile then the problem reappears. ;-(

Also have had it since September of last year. Wonder if it's still under warranty.

Then there is another Uniden which is sick too---it's a thousand channel----bc 785---Most channels are programmed, via software, to have a 2 to 4 second delay---BUT when a transmission is heard it always starts scanning before the transmission is complete---Any ideas?

If I ship the scanners back should it be to Uniden or someone who specializes in scanner repairs?

make sure the 2-4 second delays are set for +2 and +4 seconds and not -2 and -4 seconds. Not sure if that radio has that option, but some radios (like the 396xt) have a minus delay in where the scanner will be forced to start scanning even during a transmission after the set amount (-2 or -4 in your case)
Just a chance. Not sure.
Bob

Also make sure no priority is causing it to start scanning again.

9079. headphone jack and programming software question

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-07-12 04:52:08 UTC
From: Eddie Ragasa
Topic: 9079 Message: 9079

Good Evening,Just got my BCD 396XT last Monday and having lots of fun playing around with it. At first I had some difficulty in programming it but once I got the hang of it, it was very easy. I've had many analog scanners but find that more and more of the stuff I want to listen to have either gone conventional with a digital NAC option, have moved to Motorola's P25 Phase I system or digital trunking on the 400 MHz band. I'm even seeing lots of the new 700 MHz frequencies already being used on several systems here in Northern California. With that in mind I have a couple of questions in regards to this scanner.
1. Why is it that when you plug headphones into the headphone jack it sounds very, very low even with the volume turned up? Even the internal speaker sounds better than the headphone jack.
2. Also, even though I know how to program this radio without looking at the manual, it is very time consuming especially if you have lots of systems. Is there software for this scanner to help aid you in programming the radio?
Thanks a lot and I look forward to contributing and reading on this forum.
Eddie Ragasa

Is your headphone plug stereo or mono? It should be stereo.

1: as Joe says make sure you have a stereo plug.
2: FreeScan software is the best. There is also BCTool and Butel products but they are not as good, especially in the customer support area of things.

As already posted, check to see if you are using a mono or stereo plug, just to assure the correct jack is used. I believe the manual informs users that the headphone jack is deliberately "dummied down", reducing the volume as a safety precaution so as to not cause injury to your ears when plugging in a headset when the volume is all the way up.

UNIDEN repair service can take around 6 weeks for turnaround. But they do a good job of fixing the problems for a set fee. I don't know what that is now but when I sent in a scanner it cost $60. Be sure to read their warranty policy on repairs and follow the instructions regarding what proof you need to send them regarding purchase date. A copy of your receipt, for example. Copy down the serial number of your radio to see if they repaired your radio or swapped it out for a refurbished unit when it is returned to you. If you want the same radio back, include that in your note that explains the problem you are having.

Programming software is available for the 396XT. Just try doing a search for it. Some of the programming software has the ability to link with Radioreference.com. You can search by state and county, pick and choose what systems you'd like to program into your scanner, and download it directly into the scanner. But I believe you must be a premium member on Radioreference. In order to program the scanner this way. Otherwise, you need to manually enter the stuff you see on their site. Radioreference doesn't charge much to get this ability which I believe is well worth it. Uniden's newer scanners (BCD436HP & BCD536HP) have an SD card which allows you to download Radioreference's entire database, covering the US and Canada, storing it all on the SD card. This database is updated on a weekly basis and can be downloaded as many times as you like into the card. Once the card has the database, you can search it using the scanner and program your radio without the computer connection to your programming software. This ability eliminates the confusing issues newbies can experience when trying to program the different types of systems (conventional and different types of trunked systems) because it sets up all of the correct parameters (settings) for each individual system for you and programs the scanner correctly.

Hope this helps,
Bill

1) Headphone jack may produce lower volume to protect your ears. I've had one of these great scanners but i dont remember if the hearing protection is an option that can be modified or not.. also make sure the plug is a stereo plug (like a standard pair of music headphones) or half of your audio will be diminished right off the bat.

2) Lookup a program called Freescan on the web (www.freescan.org i believe) and you'll really enjoy this software for programming and controlling this fine scanner.

Good luck!
Lee

I really thought I'd never see that... if you want the same radio back. RS did me that way I had bought a new p96 and almost two years in (under Ext warranty) and they sent me a crappy looking radio back, like what the hell, why can't the consumer/end user expect to receive his property back, and what really pissed me off is they tried to play it off as the same radio. The thing is the ser# didn't match the warranty papers.
I guess that is their way of getting out of a free repair.

Hello,

I am new to this. I received the BCD396XT scanner. I would like to program for my area but I am not sure how. I live in the Lehigh Valley in Pennsylvania. I did post a thread on Radio Reference but they act like I have skills in all of this and they gave me a link to some kind of manual which I am not sure how to follow. I might be able to follow out a step by step or a video on how to program it but that was not provided to me. May I please ask how do I program this BCD396XT scanner? Thank you!!

Watch some videos if you have trouble with the manuals. It is not intuitive, there is a learning curve.

Agree, and also I recommend to use a computer for any serious
programming, as this will save a lot of tedious button punching. I use
Freescan, which works well with the scanner.

***** Anything you find out, I'm right behind ya! The only way I got my thing programmed was to call customer service & after 2 hours the operator gave up trying to explain it to me & walked me through, step by step, programming my area! LOL

I'm totally uneducated when it comes to scanners -- can't understand the lingo or the "manual" that's provided online. I'm thinking this was a very expensive paperweight, especially since my town (after just upgrading to P25 -- my reason for purchasing this scanner) is now going "encrypted". Between the one encrypted line, and the fact the PD communicates via text message/computer in their cars, I'm thinking I wasted a lot of money! :-(

I don't own a 396XT, but I've done a couple of data files just for brain exercise.

I still have FreeScan installed and would be glad to take a stab at it.

You will need the correct cable and to upload my file, would eventually need to also install FreeScan (free).

Being in Texas, and not familiar with PA, what I need are lists of the counties, municipalities, specific agencies, and your interests.

Else, I have to work from maps.

IOW, I usually just include fire and LE, but add EMS or Emergency Ops if requested

Subject: [BCD396XT] How do I program BCD396XT scanner?

Hello,

I am new to this. I received the BCD396XT scanner. I would like to program for my area but I am not sure how. I live in the Lehigh Valley in Pennsylvania. I did post a thread on Radio Reference but they act like I have skills in all of this and they gave me a link to some kind of manual which I am not sure how to follow. I might be able to follow out a step by step or a video on how to program it but that was not provided to me. May I please ask how do I program this BCD396XT scanner? Thank you!!

Depends what you want to scan. I think we'll see more and more police going encrypted. In Australia, the bigger cities have been encrypted for years. Out here in the sticks, they still use analog VHF FM, so you can monitor the police here. Looks like it might be a while before the state's police radio network is upgraded.

However, in my case, I didn't buy the scanner for police monitoring, as a volunteer firefighter, fire traffic is of more interest. The fire dispatch network here has recently been upgraded to P25, but because both volunteers and the general public monitor fire traffic to keep a heads up on anything that might affect their area (e.g. hearing a request for more resources can mean I'm already halfway to the station before we're paged - I can make an educated decision based on where the fire is and what is requested), the network is trunked P25 but unencrypted, perfect for the 396XT. I have since programmed what was known of the network a couple months ago (which included the key base stations around here), and the scanner does an excellent job of receiving traffic.

So, how useful the scanner is depends on one's interest and the decisions of authorities in your area. However, I'd say that police monitoring is a dying pastime. I can't see many PDs wanting to keep their traffic in the clear. Fire and other services are a different story, depending on local culture and community needs.

I also found a paid subscription to radioreference.com is very useful,
as the ability to import directly from the radioreference.com database
takes even more of the drudgery out of programming the scanner. The
cost is quite inexpensive. Use it once and you've got your money's worth.

What do you want to monitor there? I can make a file for you. I used to live in the valley so I know the area.
Download FreeScan and I can send a file that will work with that.

With the supplied cable. If your PC does not have a serial port, buy either a USB-1 which replaces that cable or buy a serial to USB adapter for a couple bucks on eBay.

I have a freescan question:
I have that same version I had when I had a subscription to RR.
My question is why now that I don't have a subscription is, freescan
telling me that the file is no longer valid with the version of Freescan I
am using!!?

Wirks with Freescan too. I recommend trying Freescan, since it costs
nothing. If you find you don't like Freescan for some reason, then
there's a number of commercial alternatives to choose from.

Firmware update is very easy with BC_VUP.

It would help if you specify which SW you are using.

9120. Clearance prices at certain RS stores

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-07-18 07:34:50 UTC
From: Cory Ricci
Topic: 9120 Message: 9120

This seems to have gone around a few times with some left unanswered. I swung by a smaller Radio Shack earlier today to see what I could find out myself and even though the one employee there had just started 2 weeks ago he did tell me there is quite a few of the stores getting bought out but most to be staying as RS stores...how much this had to do with the prices I found on stocked Uniden units is uncertain. What is though is they had brand new 996XT's on clearance for $174.97 as of today and sounded likely it would drop more as their buyout date got closer if they had any remaining (which I'll make sure they don't lol). The 396XT was at a similar slightly lower price than the 996 was going for but they only had one left as far as the kid knew. I did snap a couple pics of the price tag that also has the SKU# on it if anyone needs to see the proof for themselves that this is happening at many stores across the country. I'm going to stop by a couple other ones near me tomorrow to see how they differ. This was in suburban Minneapolis, MN.

You must have been talking to someone in a Dealer store, which operate independently of RS Corporate stores. RS Corporate stores have not been bought out. (Also possible new employee was just uninformed and not willing to say "I don't know.")

Anyone know what is the store RadioShack SKU number for the portable
BCD396XT? I could use one of them.
Thanks,
Bill E.

Correct, I think we/the group had already deduced that the only stores even capable or willing to do this at such a low price were the dealer or franchised type of stores and that the corporate ones knew little or nothing about it nor would typically be able to honor the close out prices that some of the dealer stores are offering.

Is there any way to locate the non-corporate-owned stores? I know the places that are clearly some other store but have a "Radio Shack" sign added on, with a few parts racks, are not, but I don't have any of those nearby.

Failing that, if someone wants to pick me up a 996xt for $200, I'll happily pay you $50 additional for shipping + your hassle :)

9125. BCD 396XT - CLOSE CALL- NOT DIGITAL SIGNAL.

From: Uniden UPMan
Topic: 9125 Message: 9126

Turn off CTCSS/DCS search in the Srch/CloCall Options. With that on, the scanner will treat all Close Call hits as analog and will never attempt P25 decode.

Another possibility then:
If the digital signal that is being captured is encrypted, the radio will mute the audio and you won't hear it (Thank You Uniden for this feature!)
Also, try this:
Go to Srch/CloCall Opt-- Tone/Code Search-- select P25 NAC Search- Enter
This will force the close call mode to P25 only
Bob

in my small country police operate on frequencies 866.2750-868.9875 scanning these frequencies it works fine.
but in close call not picking up anything just analogo signals.
I was told to set ctcss/dcs off.

Close call means just that, close, very close. It isn't like normal reception where you can hear signals up to 50 or more miles away. Usually a quarter to one half mile is good on Close Call.
If your searching for new channels the best bet is to use Search as that will hear farther than Close Call will. So search your 800MHz frequency range instead of using Close Call.

Are you using the stock antenna? If so, are you sure there are
cars within a quarter to a half a mile of where you are?

Ctcss/dcs must be off to decode digital signals,
but that's only if you are picking any up.

LWIN (Louisiana Wireless Information Network) APCO 25 phase 1.

For Monroe PD you need to program this trunked system. Once you identify which talk group is for Monroe, you will receive them. If they are encrypted you will hear their transmissions as possibly a hissing noise, but nothing that is understandable.

Thank you for your patience with me. My scanner came with an old serial import cable. So I had to order an USB cable.
What software are you recommending to download the trunk system?

I recommend Freescan, and getting a paid radioreference.com
subscription. Freescan works well, and when combined with the
radioreference subscription, will allow you to download the system
directly from the radioreference.com database.

9141. BCD396XT Help

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-07-29 23:33:02 UTC
From: thoffmeyer2001@...
Topic: 9141 Message: 9141

Ok Help the old guy. Just got BCD396XT and using Frescan I was able to load my first system #1 with GRP in it. But Iam lost as to putting in a second system #2. When you mark the #2 box do you unmark box #1 or just leave checked also. I have watch some utube from a few guys but I am just not getting the info I need. Also when scanning after getting more then one system in will it scan more then one system or can you only scan one system at a time. Sorry I just having hard time getting this straight in my head. If anyone has a link showing how to do what I am looking for would be great. Thanks for any help. KC7RHT

You can scan multiple systems. Which #2 box are you talking about? The upload list box?

If the two groups are in the same system, you can check them both and they will both be scanned after you write to the scanner. You can change the state of the enabled groups using function-# at any time you are scanning tat system.

Schuylkill County,Pa will be switching to APCO project 25 in the future.With the Butel basic do I just program (through the drop box) their channels for DIGITAL? Is there anything else that has to be done?

Also how do I enable/disable close call?

73'

If its P25 conventional, yes, just set the channel to digital.
If its a trunked system you have to program it as P25 trunked.

To enable/disable Close Call, hit Function-Hold while stopped on a channel.

9148. Distorted Reception at Times

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-07-30 19:40:03 UTC
From: richaja1958@...
Topic: 9148 Message: 9148

Could someone please explain why I am getting distortion at times? It is very clear at times and other times it is distorted. I move it to different spots but it doesn't seem to matter. It does it with a fully charged battery as well as when the battery is a little lower. Someone told me the standard antenna that comes with the scanner is sub-standard and that may be the source of the problem. Any truth to that and any recommendations on what type of antenna upgrade I may need to consider.
Thanks for any ideas you may have.

It's most likely interference which the antenna likely wont help (any antenna).

Maybe you could specify which system this is on (state, county, and system name).

You don't give much to go on. But generally poor reception can be caused by MANY things. A poor antenna being just one of them.
Add in, location, trees, buildings, materials used in the construction of the building, age if the building. Hills, mountains and much more.
Yes, even the age of the building matters. The older the building the more lead in the glass and paint. Lead blocks radio signals. Aluminum siding and metal roofing blocks signals. Oh, and weather affects it too. Leaves on trees block signals, even more so when it rains.
The type of system also matters but you didn't say what it was....

Sorry for the blank reply before. Depending on the system type, a poorer antenna sometimes helps. My 'normal antenna' is a stubby race antenna. I usually hear what I'm interested in which is the local municipality at the time.

Check the frequency and determine if another close adjacent signal is there--

In a message dated 7/30/2014 4:35:07 P.M. Eastern Daylight Time, BCD396XT@yahoogroups.com writes:

Could someone please explain why I am getting distortion at times? It is very clear at times and other times it is distorted. I move it to different spots but it doesn't seem to matter.

Multi path could be an issue. Does it happen on any channel or just one? If it is multi path try turning on the antenuator for just that channel (not globally). That's the same thing as putting on a less capable antenna. Multi path signals are produced by the system you listen to if they transmit on more than one antenna at different locations. They do that to ensure coverage over a wider area and their radios are more able to discern the single signal the radio wants to listen to. "Simulcast" is another term used to describe a system's operation and can be the cause of multi path.

9158. SEARCHING FOR PL/DPL

Is there a way when monitoring a channel to have the unit search that frequency for a pl/dpl using the Uniden bearcat 396xt scanner itself from the front screen? I could do this using the Butel software but that wouldn't help me when I'm mobile.

Yes. Set it for analog only and turn CTCSS/dcs search on.

Rule of thumb, most everything you can do in software can be done
manually in the scanner as well. Short of changing the startup screen,
sort alphabetically/talkgroups/frequencies.

Be sure to read any manual you have , its in there,
http://marksscanners.com/396XT/396xt.shtml#edit channel options

When it decodes the pl, it will flash on the screen and normally you can
just push the E/yes key and it will ask you if you want to use this...
then push the E/yes key to do so.

In software as it is easier to do so, if the pl is not known, I always
set it to search.

Just set the audio for analog and the squelch for search. The squelch
option will come up as soon as you set the audio type to analog.

Part of what you want is in the "Keypad & Knob Control" section,
part is in the "A Look at the display" section,
part is in the "Edit Channel Options" "Analog Only" section,
part is in the " *Tone/Code Search* " section.

You have to read through parts of the manual. But "it's in there."

Hearing something interesting this morning at 7:30am.

154.845 is used by Wilkes Barre,Pa police as a repeater output. As I write this a BOOMING transmission using P-25 digital. The base unit identifies as "1200" and there is lots of talk about mileage readings..This P25 comms is coming through a repeater. Either this is something new or "ducting"

Anyone else hearing this?

Let me know what you find out about the batteries not charging whether that somehow might be a firmware update issue you had or that was a problem beforehand. One of my 396XT's won't charge any NiMh's at all with the switch set to NiMh (although I much rather prefer doing all battery charging with an external charger anyway, I just like the option and knowing everything is working) and acts like it's set to alkaline with the display saying 'Charge Off' when the power supply is plugged in which makes me think my issue lies with the little dip/microswitch itself, I just don't want to send it in a

Was your radio set inside (programmed) to charge it has settings to charge
at different hours. I guess I am asking if it is set to *charge off *and
the switch is set to rechargeable batteries it won't charge.
It is always better to externally charge anyway.
if you can plug a external speaker to it and it has audio it could be your
speaker, if not it could be more serious problem like a sound driver.
hope this helps

Try resetting the scanner to factory settings. Check your speaker by plugging in an earphone-if you hear through the earphone jack maybe you do have a problem with the internal speaker. Watch the display also... Does it stop on a busy channel? But no audio? If you do send it in for repair (a reasonable cost considering they fix just about anything without charging more), the only drawback is the turnaround time... Could be 6 weeks. As for battery charging, I thought it worth mentioning the reason we all tell you to charge your batteries in an external charger... To be more specific, use an external charger that trickle charges your batteries AND shuts down when fully charged. The internal battery charger in the radio charges at a trickle level but does not shut off after the batteries are fully charged. So the batteries become hot. Heat is a battery's enemy. Ideally, a battery should be charged at a slow rate, keeping the heat at a minimum, and removed from the charger when fully charged (unless the charger has an automatic shut down feature where it stops charging when it senses the batteries are fully charged. This is true with any item you buy that runs on rechargeable batteries and has a built in or external charger included. Make sure it's got the ability to stop charging automatically or you just end up frying your battery pacs because you forget to remove them after fully charged. An extreme example of this is when storing your motorcycle or lawn tractor battery (rechargeable batteries) for the winter months using a trickle charger that never shuts off. Battery "conditioners" are another name for trickle chargers WITH automatic shutoffs. They sense when the battery is charged and shut down, but continue to monitor battery strength and come back on when the battery drops below a certain level. Also, if you do send the scanner in for repair, have them replace any cosmetic issues such as worn keypads, scratched display windows, cracked case covers, worn battery covers etc. and keep in mind they may decide to replace your scanner with a refurbished unit instead of returning your original unit. Specify in your note describing what you want them to do to fix your radio, your preference should they decide they want to swap it out.

I was wondering about the MOSWIN feed for troop D, my radio hasn't been very active on that but on the VHF-LO it is blasting me.
I was wondering if Christian County will be going to MOSWIN or if they plan to stick to the system they have if so can someone tell me how to program mine. you may contact me offline.
Thank you for your time.

I recently purchased this scanner and I'm enjoying it very much. It's been eating through batteries almost every day. I've disabled the back light which has helped but I would hope the batteries would last a few days. I buy duracell's and they don't last long.

Jason

8 hours is typical. Buy some rechargeable NiMHs and a charger.

I agree with Joe. Much less expensive in the long run. IMHO.

And the worst thing the bleeping low battery audible alarm cannot be muted or changed in any way.

It goes on and on and on and on and on and on.

lol yup, that or turn off the scanner....that stops the endless beep too.
Of course there is a third method, but it can take a few minutes and personally the beep annoys me too much to do this, but just wait until the beeping stops on its own....

Ahhh reminds me of the old VCR flashing midnight all the time lol...they don't fix themselves. I would say the life you're getting is to be expected and wouldn't suspect any issues. Check the battery voltage along with battery save settings and use quality NiMh's s and you should get what specified/eauell

Actually, I think you can set the beep level, too, so its softer. Of course, it affects all beeps.

Super Secret Low Battery Beep Hack... Good, very good. Does this hack require the use of millivolt flakes? Low resistance ohm powder? I found both have a very profound effect on the scanner's performance... Just gotta do a little trial and error on how much to use.

Get rechargeable AAs. Its about 20$ for 4 and a charger. Makes the scanner last much longer even with the backlight.

Turn beep level to zero
It will run for another hour or two
That will stop it.

seems we got some very funny comedian's. The best I get is about 4 hours, maybe I should send mine in it is still under warranty.
yes, rechargeable's are the way to go with a external charger!!!!! don't ask me why or how I know just do your self a huge favor and buy one.
also watch how may mAh the rechargeable's there are several and the lower the mAh the weaker or less power and enjoyment you'll receive the ones that come with it are 2300 mAh so keep those eyes open before you spend your hard earned cash.

If the best you get is 4 hours, either you have constant activity at full volume or you need to condition or replace your batteries.

All I listen to on it is MOSWIN and even that is sketchy at best most of the time until I get to about Ozark in Christian County, Missouri from Springfield and Maybe I hear a Trooper calling Dispatch and then I am at work... I have to admit I do have the audio cranked up to about 10 and have it plugged into my aux on my stereo which I guess I could turn it down since it is being pushed by the vehicle stereo. It has did that from the git-go the sales clerk what showed it to me held on to it and didn't even act like I could touch it when I told her I would take it she disappeared into the back for about 10~15 minutes and I was about to say F it and just leave I often wondered if it wasn't a display model or one they used in the back and had a hell of a time finding the box it belonged in.

I have bought 4 sets of HF rechargeable's and in another post as I stated watch your mAh I learned the hard way, what I didn't state is that you probably wouldn't want to buy over the 2300 mAh ones that came with the radio or you could possibly ruin the radio. maybe someone more knowledgeable can pipe in on this situation with the battery mAh anyway.

Oh, this radio is less than a year old. what do you mean recondition my batteries if they won't last more than 500 recharges then I will just throw the ------ things away!

4 hours on rechargeable? Something not right as I have a very busy area here and get 8 to 12 hours on a charge with 2300Mah batteries. And.that's with the backlight on and high volume.

Sent from my Verizon Wireless 4G LTE DROID

Some chargers have a recondition mode that drains them completely and basically it reprograms them. Nicads get a memory and only recharge to that point. Reconditioning takes care of that
Some use 2900Mah or more in their scanners and it won't hurt them. The 2300 is what comes with them. Its what I usually use unless I find a deal on higher Mah batteries

Thanks I was wondering about that if you could use higher ones I know that
you can get them for camera's that have a higher mAh but I was afraid that
it could burn the light crystals or led's out quicker with the extra
amperes.
Ok John now I understand buy a more expensive charger LOL, I have a new one
I bought on sale at Harbor Freight but I know that don't have a
reconditioner on it and the older one I have it also doesn't have that
capacity. I have seen them though.

Nope won't hurt anything. The added power doesn't mean its a burst of power as the scanner only uses what it needs and the extra gives extra usage time.

Think of it as installing a larger fuel tank in your car. The car runs
the same, just goes farther on a tank of gas.

9197. 770 mHz Sensitivity

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-08-09 01:08:47 UTC
From: dannyg@...
Topic: 9197 Message: 9197

Now that my main system (San Mateo, CA county) has moved to 700 mHz, my trusty and fully updated BCD396T isn't picking it up in the coastal fringe area where I live, even with an outside antenna (does get it closer to towers when in my car, so the programming seems OK). I attribute this to greatly reduced sensitivity in a frequency range for which the original 396T was not designed.

My question: Does the XT have better sensitivity in the 770 mHz range? I'd rather switch to a radio with the smaller form factor of the BCD396xx series than the humongo BCD436HP, despite the extra goodies the newer scanner offers.

Agreed. I got the 4 pack of rechargables at Walmart for under $20 and the 396xt uses 3. On a full charge they last 12 hrs. Can't beat that, the batteries from Uniden only lasted 8!

Stamford Univ is doing ongoing battery research. They just announced new technology that will permit 3 to 4 times improvement in how much juice can be stored in batteries. It will be some time before we see a double A battery for sale but when they do show up it will be fantastic. They tout usages for electric vehicles that increase recharge cycles to 300 miles, a vast improvement over the current less than 100 miles. I'm sure they won't be cheap but what an improvement. I had also heard that there are ham radio operators experimenting with lithium polymer cells. They are used in RC model airplanes currently, have longer life, allowing weeks between recharges and can be molded (shaped to fit as they are pliable packets). But I can't find anything on the Internet about specific uses. (These type of batteries require great care when recharging, rate of charge and charging each cell equally, due to heating concerns when charged improperly. They heat up and can explode. So charging should always be done outside of the model airplane or radio in an area where it's safe to do so, and in a container such as a metal ammo case that will contain a mishap. Don't want to burn down the garage or house!)

But currently, someone mentioned a 2900 MHa rechargeable AA battery... Or maybe it wasn't a rechargeable... Are we referring to the Everready Lithium AA disposables? Great batteries to have in a "go pack", as a backup for emergencies but expensive.

If you are using the scanner in the car, get a mobile power cord for the car and save your batteries for portable use. If you are taking the time to plug into the aux jack on the car stereo, what's one more connection?

You can find pretty cheap AA 3000Mah batteries on Amazon. Don't know how long they will last but I get a year or more out of the factory no name brand so..

Hi,

One thing that may not have been mentioned in details in this tread about battery life, is digital vs analog monitoring: I've seen quite a difference using my 396XT on analog only listening in my boonies vs digital intensive listening in big cities: your mileage may vary but indeed expect anything from 4~5 hrs to 8~12 hrs depending if digital / lot of activity / volume cranked-up and analog / low activity / low volume.

I've bought some rechargeables and I do have a car power adapter so I'm good. I appreciate the feedback. Only problem is that the chargers I have require the batteries to be paired so it's a little difficult to charge 3 at a time. :)

I'm not sure what your point is. Are you saying that digital signals always consume more battery life than analog - or - are you saying that a lot of activity consumes more battery life than a little activity? The latter I was aware of. The former I was not.

Thanks,

Bill E.

9206. Re: [BCD396XT] Re: Battery Life

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-08-09 18:21:38 UTC
From: Cory Ricci
Topic: 9175 Message: 9206

I'd have to agree with the last part of N1CHU's post about simply avoiding draining the batteries while mobile in the first place and getting/finding/making a 12V-6V DC to DC adapter. I happened to luck out when I was looking for one to use for one of my 396XT's as a second scanner in my truck and digging through all my ham and other radio and electronic gear, I found an old XM radio (it came with a cassette adapter for stereo decks to put its age into perspective lol) that had a cig plug with the correct sized tip for the 396's power input plug which was a good enough start alone but then looking at the specs of the cig plug adapter it was rated for exactly 6.0 Volts DC @ 800mA exactly as the Uniden 120V wall adapter the scanner comes with is, so this XM vehicle power supply I ran across happened to be a direct fit and spec'd to supply plenty of power to run it and charge even higher capacity NiMh batts if I ever had to do so. But I will agree and reiterate as many others have said that I'd always use a quality external charger that can charge, maintain, monitor and condition individual cells rather than the cheaper chargers or 'rapid chargers' that use a relatively higher voltage and much higher charging current rate that creates quite a bit of heat in the cells. And some just are timed so you're in the dark if you're overcharging them or not besides how hot they'll get.

As far as the question about the 2900 mAh (milliamp hours) (not MHa, sorry not trying to be a spelling nazi, just trying to avoid confusion with anyone out in scan-land) batteries, they are referring to NiMh (Nickel Metal Hydride) rechargeable batteries. I haven't seen many I can remember (if any at all that I've looked at) non-rechargables that list a mAh rating/capacity but that could for a few reasons like them not wanting you to know how similar most of them are also how alkalines perform/discharge under load differently compared lithiums (not Lithium Ion or or Lithium Polymer) which are geared more for higher drain applications so some of the numbers could be misleading. But for what it's worth the specs for alkaline batteries and lithium, which are usually combined with Iron Disulfide (Li/FeS2), do have detailed specifications and datasheets with discharge profiles and many other test graphs showing their performance under several testing conditions/loads/temps/etc online (like data.energizer.com/PDFs/l91.pdf) and it appears most alkaline AA's would be rated just over 3000mAh. It might not seem like much more than the higher capacity NiMh AA's but keep in mind one last rating that makes a big difference: non-rechargables like alkaline or lithium are rated at 1.5V (though new they tend to read above 1.62V) while Ni-Mh are rated for 1.2V so the net power capacity of an alkaline hypothetically rated at 2900mAh vs. a NiMh rated for the same 2900mAh would be higher since the slightly higher voltage it puts out translates into being able to power a device consuming so many watts for a longer time in many circumstances.

I'm sure someday soon we'll see a readily available 1.2-1.5V Li-Ion AA rechargable cell (which would almost definitely have to be recharged by its own charger and not any internal one a device may have) but right now all I've seen in a AA size are rated for 3.6-3.7V which is what I've seen in repairing some 18V Li-Ion batteries for power tools that have been left out in the rain and fried circuit board components, those seems to have been similar 3.something volt cells wired in series (or series-parallel in the case of the extra high capacity ones) to achieve the 18 or so volts for the power tool. The AA Li-Ions I found on a quick google search were on eBay or Amazon or something like that and were

mostly only rated for about 750-850mAh but I did find some supposedly rated for 2400mAh (again these are 3.6V), I only mention this for the electronic geeks and the likes out there that might see something useful with these. If one were to wire 3 of these in parallel side by side (so they'd hypothetically still fit into a 3 cell battery case) you'd still have your 3.6 or 3.7 volts they rate at (likely actually be a bit higher as most batteries are) but the mAh ratings would then add up so the sum of the cell's ratings would be the net capacity rating so even the 800mAh ones would be an equivalent 3.6V Li-Ion rechargeable pack now rated at 2400mAh, if these other ones I see on Amazon are really 2400mAh each cell then 3 in parallel would net a 3.6V pack with a 7200mAh capacity! That's pretty similar to Mophie power packs and similar ones like it for charging smartphones and tablets from almost dead to 100% (which by the way most or at least many of those use the Lithium Polymer type of rechargeable battery). I wonder how long that would make a 396 last lol! A big side note to all this is that a home brew Li-Ion pack like described above or anything similar would require the knowledge about how the 396's battery compartment and unit is wired for batteries and to take measures to assure the correct polarity of the 3.6v Li-Ion pack is applied to only the two contacts that supply the scanner, so picture most rechargeable packs that have insulating material wrapped around them to protect each cells contacts to only allow the net output voltage to be connected. (which if anyone was serious they'd likely have to modify the battery cell holders if the springs made for too tight a fit) since normally they lay in reversing directions to create a series circuit making the supply voltage the sum of the 3 cells' individual voltage while the current/amperage rating remains the same rating of one of the 3 cells, so 3 2300mAh NiMh cells@1.2v in sires would yield roughly 3.6v but still at 2300mAh. In contrast; in parallel those same 3 cells would yield just the 1.2v but now at a 6900mAh capacity.

Or.....just keep it plugged it at home and while in the vehicle :)

Stamford Univ is doing ongoing battery research. They just announced new technology that will permit 3 to 4 times improvement in how much juice can be stored in batteries. It will be some time before we see a double A battery for sale but when they do show up it will be fantastic. They tout usages for electric vehicles that increase recharge cycles to 300 miles, a vast improvement over the current less than 100 miles. I'm sure they won't be cheap but what an improvement. I had also heard that there are ham radio operators experimenting with lithium polymer cells. They are used in RC model airplanes currently, have longer life, allowing weeks between recharges and can be molded (shaped to fit as they are pliable packets). But I can't find anything on the Internet about specific uses. (These type of batteries require great care when recharging, rate of charge and charging each cell equally, due to heating concerns when charged improperly. They heat up and can explode. So charging should always be done outside of the model airplane or radio in an area where it's safe to do so, and in a container such as a metal ammo case that will contain a mishap. Don't want to burn down the garage or house!)

But currently, someone mentioned a 2900 MHa rechargeable AA battery... Or maybe it wasn't a rechargeable... Are we referring to the Everready Lithium AA disposables? Great batteries to have in a "go pack", as a backup for emergencies but expensive.

If you are using the scanner in the car, get a mobile power cord for the car and save your batteries for portable use. If you are taking the time to plug into the aux jack on the car stereo, what's one more connection?

Buy a more updated charger that charges individually. With one that charges in pairs, one of the cells won't be getting a complete charge unless the cells are electrically identical which is very unlikely as they will age differently.

Digital may consume more power since it dose have to pass through the Vocoder chip(s) and be processed into something you can hear and understand.
The 436 uses more power than a 396XT but it also uses different and more powerful chipsets.

And trunked has to monitor and decode the control channel which adds
a little bit of power consumption. Trunked digital is a 'double whammy'.

If your charger requires "pairs" of batteries for charging then you have a crappy charger. Any decent modern charger has a separate charging circuit for each cell and turns individual cells off when the optimum charge is reached! Pair chargers can ruin cells. Try a good Maha charger or similar quality brand.

And with digital it is always (or depending on the system(s) and how it's setup--usually) monitoring the Control Channel or or CC's of how ever many Sites are in any systems in your scanner regardless if there is radio traffic or not. On top of that it is also doing CC signal monitoring and optimization or 'housekeeping' which can usually be seen when scanning a Site/CC during no activity the signal strength meter will flicker out/down very briefly (milliseconds). So that along with what John said about the digital decoding process turning the data bits into an audio signal we can hear do consume more power than an analog signal/system.

Duracell makes individual cell chargers, suprisingly Sanyo does not. If
you can find them, the Duracell chargers are less expensive than the
Maha and seem to work as well.

NiCads (rechargeable batteries such as AA's we are talking about here) were touted as being able to be recharged 1000 times. But that is ideally. Realistically, we normally don't see this because we don't recharge them optimally. We end up buying that 4 pack of batteries that come with a cheap charger-the type where you need to charge at least two at a time. My thinking on that is most battery operated electronics use an even number of batteries (and don't forget, battery manufacturers are in the business of selling us batteries-the quicker they die, the more sales they make!). So buy a decent battery charger like the Maha mentioned that can charge a single battery at a time in any of the ports and also "recondition" batteries you think need it. Then stick to religiously using that charger instead of the built-in one that comes with the scanner. Uniden's Paul Opitz has even advised (or agreed with the practice of recharging outside the scanner). 1000 charges, done on a daily basis means there should be about 3 years of recharging cycles but as the batteries age, they will not perform as well as when they are new so expect a diminishing return on length of operation the older the batteries get. I have not gone 3 years with one set of 3 AA cells and don't expect to. I routinely swap out my 2 sets of 3 batteries each year. I put the old sets to work in TV remotes and the such. (Don't plug them into smoke detectors or CO detectors-use only fresh disposable batteries for life saving applications).

I do like to use the higher rated MHa batteries like the 2600 or 2700 MHa batteries as they last longer per recharge. They cost a bit more than a 1500 MHa battery but I find they are worth it.

i have 3 sets of powerex (maha) batteries that i rotate and charge with a maha charger. over the years the capacity has gone from 2300mah up to 2800mah with my latest sets i think. these batteries usually last me 8-14 hours depending on type and amount of traffic and a set of batteries will last up to 3 years using the rotation and re-condition routine. i don't know what the cost-per-day works out to, but it can't be much even considering i usually replace the charger every 5-6 years. the total initial outlay is less than $100.

I'm guessing you mean NiMh (Nickel Metal Hydride) batteries in regards to the rechargeable ones referenced in this topic. NiCd's (Nickel Cadmium) do have their own pros and cons but most I've seen that are still made in AA size are a pretty low capacity, usually less than 1000mAh and are typically used for solar landscape lighting type of applications as they are cheaper and have a bit less of a self-discharge rate and handle being over discharged and over charged better than NiMh counterparts which makes those attributes a great fit for the LED solar lights that don't need a large capacity with such a low draw (and the small photovoltaic panels on them would rarely, if ever, be able to fully charge something like 2300-2900mAh cells anyway). But in any case with rechargeable batteries it is always best to use a good charger that has the capability to condition cells and charges and monitors them individually so you can charge one, two, three or how many ever it will hold at the same time. The ones that only do pairs or 4 at a time charge in series so one cell may get way overcharged while the other could be only 80-90%. That and as another person said, rotating the cells when changing them out and charging them will help get the most charge/discharge cycles, capacity and overall life out of them you can. These good chargers and good higher capacity NiMh batteries aren't that expensive so I'd say they are an investment well worth making for a scanner worth as much as these are :)

NiCads (rechargeable batteries such as AA's we are talking about here) were touted as being able to be recharged 1000 times. But that is ideally. Realistically, we normally don't see this because we don't recharge them optimally. We end up buying that 4 pack of batteries that come with a cheap charger-the type where you need to charge at least two at a time. My thinking on that is most battery operated electronics use an even number of batteries (and don't forget, battery manufacturers are in the business of selling us batteries-the quicker they die, the more sales they make!). So buy a decent battery charger like the Maha mentioned that can charge a single battery at a time in any of the ports and also "recondition" batteries you think need it. Then stick to religiously using that charger instead of the built-in one that comes with the scanner. Uniden's Paul Opitz has even advised (or agreed with the practice of recharging outside the scanner). 1000 charges, done on a daily basis means there should be about 3 years of recharging cycles but as the batteries age, they will not perform as well as when they are new so expect a diminishing return on length of operation the older the batteries get. I have not gone 3 years with one set of 3 AA cells and don't expect to. I routinely swap out my 2 sets of 3 batteries each year. I put the old sets to work in TV remotes and the such. (Don't plug them into smoke detectors or CO detectors-use only fresh disposable batteries for life saving applications).

I do like to use the higher rated MHa batteries like the 2600 or 2700 MHa batteries as they last longer per recharge. They cost a bit more than a 1500 MHa battery but I find they are worth it.

I agree 100% with N1chu and have personally found all that he has stated. I use the MAHA, 2700 mAHr batteries with their MHZ-C9000 charger/Analyzer and find both their batteries and charger/analyzer excellent values. I am an electrical engineer and researched the charger analyzer and read their (and continue to brush-up on that reading) often. Again, N1CHU has provided excellent advice and information.

Thanks Ken,

I use the La Crosse 1000 (there are two letters that preceded the 1000 but I forget) charger. There is video on their website along with specs that someone referred me to. After researching it I bought it! Any charger that allows you to adjust the charging rate (or use the default 200 Mah setting), shows the level of each battery charge, and shuts itself off when done (among other features) is the only way to go if you are attentive to getting the most from the batteries. High capacity rechargables ain't cheap! I consider it taking care of my battery investments.

9220. Bluetooth transmitter

Hello all,
Looking for a bluetooth transmitter that will plug into the BCD396XT to give me scanner audio onto my existing bluetooth earbud that I use for my cellphones. I've searched a little on Amazon.com but thought I'd throw the question out here to see what others have used successfully or not so successfully. Preferably something small with good battery life.

Thanks,
Mike

I don't know if they're still available, but I use a pair of Creatie bluetooth earphones, they come with a dongle that plugs into the radio. I've never tried them with my cell, so no idea if they work with both at the same time.

Looks like there are plenty of available options on the ol web, I'm always a bit weary of buying some things from certain sites that it comes directly from China or something like that or cases where the product can actually be a fake/clone or the real version. But if you do find one you like and you only plan on using it for this purpose then I'd look for one without the extra features like capability to control play/pause/forward/backward/etc which would likely save you some money. Otherwise they don't seem that spendy at first glance so if you might potentially use it on an MP3 player or something like that then those features may be worth it. My experience with Bluetooth devices such as those we're discussing is that they draw a relatively small amount of power and tend to have a pretty long battery life, especially the later protocols of Bluetooth that improved on consuming even less power than earlier versions.

You did give me a good idea though, this device you're talking about would be great for my mobile scanners instead of using external speakers on some or all the units I would easily be able to use something like this and pair it with either my stereo deck and listen to a scanner through my car speakers without the Aux In cable or pair it with my GPS navigation and listen to the audio from that (it has BT hands free calling and even an A/V input for a backup cam so the audio quality and intensity are surprisingly quite good for a little speaker on it)

Thanks for the input, Cory. You bring up a good point in that I don't need any fancy controls on the transmitter, as it would only be used on the 396XT. My earbud is a rather pricey Plantronics model that allows it to be paired simultaneously with two different cellphones. Works good when I'm carrying my personal phone and my work phone as it pairs with both and allows answering a call from either phone. I figure I could pair it with my personal phone at the same time it's paired with a transmitter on the 396XT, and kill two birds with one stone so to speak. Just not sure if the scanner audio would mute when a phone call comes in. I just hate wired headphones or earbuds where I'm always getting tangled in the wire and it looks too geekish. Nobody seems to notice a bluetooth earbud, which makes it ideal for listening in a store or out in public.

I'm not sure about how yours works with using multiple paired devices. I would guess it would mute it (or think you're putting the other 'call', the scanner, on hold). A search for the manual or yours or if you still have it should be able to answer that.

Hi,

I've bought a Cardo BT II transmitter and I use it successfully with my Plantronics BT earbud.
Only drawback is it requires an 2.5mm to 3.5mm adapter to fit my BCD396XT, as it has a 2.5mm male plug (3/8" plug in the US system I think).

how long will it last on a full charge? does it go into stand by mode if the scanner isn't talking or is it a constant on? what I mean is if they only talk a couple of times a hour would it last longer than 8 hours?

I can't say for certain but most of those situations and surveillance are either conducted on a lo band freq where you will have to be right on top of the action and getting yourself into hot water or it is encrypted.

From: richaja1958@...
Topic: 9148 Message: 9238

Thanks for all of your responses. I am still having the problem with the reception being garbled on a frequent basis. It does not get garbled on analog; only on digital signals. Sometimes it is perfectly clear and then it gets garbled just like that. It doesn't seem to be a programming issue. Sometimes I get perfect reception. I live in Winnebago County near Oshkosh WI. I went out and bought a RS800 antenna and that didn't help. I can listen to the scanner with no antenna on it and it makes no difference. The signal is so strong where I live I get perfect reception with no antenna but it still ends up garbled at times just like it does when I have an antenna on the scanner. Winnebago County recently switched over to digital. I don't have this problem when I listen to FDL county (about 20 miles away) but they are a mix of analog and digital now. There is a tower about a mile from my house and I am starting to think I get too good of reception. Do you think I should try to have the scanner reprogrammed?

It is Winnebago County; Oshkosh WI P25. They put a lot of effort into setting the system up here to ensure there would be no "dead spots" in the county. I live within a mile of a 200 foot tower which is one used by Winnebago County for their communications system. I sometimes get this garbled reception when I have the scanner at other locations as well. I have Fond du Lac County programmed in as well. FDL county is south of Winnebago County and has a mix of analog and digital now. I do not get the garbled digital reception from FDL. It is never garbled when I am listening to an analog transmission. I think I will try to figure out how to turn on the antenuator as suggested and see if that solves my problem. I really do appreciate all of your responses and suggestions.

Just my 2 cents is that when they want to talk in privet they switch to encrypted mode where the average Joe will not be able to understand what they are talking about.
If that is the case it will do you no good to reprogram it.

There are a thousand posts asking the same question and as many reasons. One thing in this case may be overload and being too close to a site.
Add to it that there is no such thing as complete coverage.
The garbleing can be from any number of things, and it can be just as bad for you as it is for users.
Weather can affect signals, when the wind blows I can get garbling on two digital systems. Terrain, buildings, trees, even the type of building can cause it. Garbled talk is NOT from encryption though. You will not hear anything but maybe a hiss or sgueal with encryption. And one other thing, with the digital systems using less power that adds to the issue.

Have a new Uniden BCD396XT Scanner, is there a cheat sheet available showing how to program Frequencies.

I am having a problem to install frequencies, also is there a simplier manual for the operation of the scanner?

Thank You,

Ron

Yes, I think ScanMaster has a great cheat sheet but I think it costs around 20 bucks. Unless you are a glutton for punishment it's much easier to join RadioReference.com for 10 bucks and download all the frequencies you could want directly to the radio using Freescan or other software of your choice.

I enter the frequency that I want being 482.5875, (New Bedford, MA PD), on the screen will have the numbers, (frequency 482.5875) along with Direct Entry.

At this point I am confused and have no idea what to do next to store this frequency.

HELP: What do I do next to store the frequency.

Appreciate any help.

It's the key with the big E on it below the 9 key. If you are having this much trouble, I would recommend finding someone local who can program your scanner for you.

I'm not surprised that you cannot follow the operations manual, as it requires understanding scanner basics which I suspect you are not familiar with.

9254. Antenna Wire

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-09-13 23:55:24 UTC
From: Mike
Topic: 9254 Message: 9254

My suggestion for Uniden is to make a stronger wire that goes from the antenna to the small board. I have resoldered it 3 times and it keeps breaking.

Please forgive my ignorance. I hardly know anything about electronics. Can I use a thicker wire in place of the thin wire? Will copper work better? Is there something stronger?

Thank you for your help.

Mike

You can use a different wire. I would suggest a braided wire which will flex more. Leave it a little longer than necessary. You must be putting a lot of stress on the connector for the wire to break. Are you using a longer antenna? An external one? Or are is your belly putting some stress on the antenna? Something must be stressing the connector. Also, are you using an antenna adapter?

First thing is the wire or the solder joint breaking . Second thing is you can use copper wire to fix it , just make sure that you tin the ends of your copper wire , it makes it easier for the wire to bond together . I have done this with several of my radios!! Good luck

I will use a braided wire as you suggest and make it longer. I am using the RS 800 antenna. I forget the name of it. Gee, I know I am getting old and am retired but did not think I was getting that obese!! LOL Seriously, I do not put a lot of stress on the antenna. Not sure why it happens. But I know it is a very, very thin wire. Maybe I am screwing the antenna on too tightly.

I will try your idea. Thanks, Joe.

I use the adapter and screw it on pretty tight. Of course, the OEM adapter actually strengthens and supports the connector. While I don't usually put a lot of strain on the antenna, there could be some if its on my belt when I'm sitting in the car. I've broken several belt clips that way.

Maybe the first time you fixed it you are making the wire tighter?

The braid ides comes from an older two-way radio amplifier that had an issue with the amplifier heating and cooling causing the metal jumper to fail. The solution was to use due soldering braid to allow that connection to flex without failure. In that case, and in yours if you use braided wire, is to make sure to not solder the whole wire which would make it stiff. Allow some flex.

9259. Re: Antenna Wire

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-09-15 10:44:23 UTC
From: N1CHU
Topic: 9254 Message: 9259

It's happened to me also. I made the necessary repair, re soldering the jumper making sure it's not a cold solder joint (I am always worried about applying too much heat) and reassemble the radio. There are two things you must be aware of after the re solder job is done... First, assure the antenna mount is securely tightened to the case. The second thing is to remember to use an antenna with a base that fits in the existing opening so that when you tighten the antenna to the SMA connector, the base of the antenna comes fully flush with the case. It it's tight against the case it will put additional strength upon the SMA radio mount by relieving what I call the wiggle factor of the SMA mount on the case. Reducing or eliminating this will stop the wire from moving. And the solder joint won't be continuously subjected to any slight movements we incur each time we inadvertently put undue pressure on the antenna base. It's that movement, no matter how slight, but continuously happening, putting stress on the solder connection that causes it to fail. Some SMA to BNC barrel connectors may not seat flush against the case, setting up the chance for movement, stressing the solder connection.

Hope this helps

Bill

Additional to the info below... If your antenna does not fit the connector as noted, an appropriately-sized grommet or neoprene washer can fill the gap perfectly.

Topic: 9261 Message: 9261

The Sensitivity on my BCD-396xt is very low. I need to determine if this needs repair, or if they all do this. When I generate a 1k tone from a service monitor into this scanner hooked in direct with coax, I can't hear it until about -93dBm or S9. The S9 tone is barely audible. My other scanners do the same thing at around -130dBm or S3. Should this be sent in, and would a new one cost around the same price as a major repair like an RF front end?

Confirm Attenuation is not turned on. If it isn't then it sounds like a repair issue.

Since you have access to the service monitor, you might want to check multiple data points (you don't mention the specific frequency you are checking, but different bands use different components).

The Attenuator wasn't on. When I did turn it on, it's totally deaf. This was tested on various frequencies in the VHF and UHF bands with the same results. 144, 150, 162, 444, and 460 mHz. I inserted the signal to TP1 right from where the antenna center connector meets the board. Same levels, same results. Not the antenna connector either. That's as far as I can go. No service manual hunting, and surface mount soldering for me.

With that, it sounds like a blown front end, and off to the repair depot it will go... unfortunately.

I have the Fleetnet System (APCO-25 Common Air Interface) here in Ontario programmed into my scanner.

When in search mode the scanner hits a patched talk group and will display the primary talk group id and the talk group id that was added to make the patch. (I don't have talk group descriptions entered).

For example: talk groups 8432 & 8288 are patched together. When active both tg id's are displayed "8432 8288".

I've also seen where a patched group shows only one talk group id twice "8288 8288".

The active group id is displayed on the bottom line of 8432 or 8288. As soon as you enter the tg description you lose the ability to see the talk group id's when they are patched.

There doesn't seem to be a way to label the groups when they are patched together.

I have seen a double TGID a couple times but had no idea what it was. Interesting "patchwork". But because I only saw it a couple times I never needed to name the TG. So even though I find it interesting I can't help you.

I like the Scantenna series. Another good one is the Ringo Ranger which,

although cut for VHF, works very well as a scanner antenna.

But the BCD436HP could (for fire, at least).

There are a couple of TGs listed that the 396T could decode (Clarington).

I just picked up the XT from ebay.com and it works fine.

I have been using analog scanners for 15 or so years - this is my first experience in the digital scanning world.

Geographically, I live in Massachusetts.

Having had previous Bearcat and Radio Shack scanners, I was accustomed to scanning pre-programmed frequencies and hearing what was caught.

I am also used to Bearcat's Close Call, acting as a decent near-field receiver.

I activated that on my 396, but there was no audio though the band spectrum analyzer, as I call it, showed a bar graph of activity in areas, but no frequencies shown, and no audio.

I plan to read the manual more, but was hoping to get some help here in how to best use this device.

I also read about pre-programming for different states? How do I active Massachusetts? I saw it in a listing but could not figure out how to listen.

Thanks!

Scott, WY1Z

You will only hear something if someone is transmitting close. You can try it out in the ham band.

9287. Scanner Monitor Screen

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-11-03 23:09:38 UTC
From: jadeseayacht@...
Topic: 9287 Message: 9287

Has anyone seen the scanner display in the red Dodge Dart in the movie "Nightcrawler" yet? Really looks trick I cannot find anything like it on Utube or online. Reports signal strength looks like a 'DMU' (ham radio) for scanners. Said SCANNERMASTER on the screen label but can't find it.
Thanks
Tom

Thanks for answering; no it''s a screen with too cool displays of signal and stuff like the Data Management Unit on my ham radio. He has three scanners on the dash and this display screen
that looks star trek !
Tom
on the red dodge dart he finally gets

reviewed the trailer it doesn't show it there
only in the movie over half=way when he has enough money to buy the red car (that hauls must be 426).
I hope when the movie is seen (not so new) there will be more interest in this. MIGHT be a hollywood invention but if real I want one. It's really like the data management unit on my FTDX5000 yaesu only glossier and cooler.

9293. Re: [BCD396XT] Scanner Monitor ScreenI am a long time bcd396t and bcd396xt user.....I have to admit that my radio shack PRO-106 is a better radio, catches transmissions sooner and holds it to the end, where as the bcd396xt only grabbed poryions of the transmission. the pro -106 is still available if you look hard enough.

9294. Question regarding digital noise on trunked system.

Yahoo group: BCD396XT (2011 — 2014)
Date: 2014-11-05 21:21:24 UTC
From: miles.madison@...
Topic: 9294 Message: 9294

Hello all!

I will start off by admitting that I just purchased my BCD 396XT a week or so ago. I do, however, have some experience with digital scanners (I own a Pro-197) and despite this, and my own research, I cannot resolve this ongoing problem.

Basically, I live in Orange County, CA and I am trying to monitor the Countywide Coordinated Communication System (See https://www.radioreference.com/apps/db/?sid=201) which consists of analog (Fire/EMS), digital-encrypted (Police), City Interoperability (Digital), and the RED channel for major incidents (Digital). I have programmed these frequencies via FreeScan and excluded encrypted frequencies. Despite this, I receive interference from unprogrammed talkgroups that consist of a digital garbling noise. For other unprogrammed talkgroups it is simply quiet, thus the scanner gets stuck on a channel with no audible activity. I believe these are encrypted frequencies but I may be wrong. Either way, I do not receive this interference on my Pro-197.

Again, I have researched this problem to no avail, but I am a novice. Could anyone offer any assistance or ideas? I have already tried locking out non-control channels but this has not worked. Is there any way I can program the scanner to exclude any non-programmed talkgroups? If necessary, I can upload the FreeScan file somewhere.

Thanks in advance for any assist you can provide!

Gosh, I feel like such an idiot. It was on ID Scan by default.

My scanning is like butter now!

I really appreciate the assistance. If I could e-mail you a cookie I would.

Thanks again,

Miles Madison

Sounds like the difference between “Search” and “Scan”. “Scan” should only pick up Talkgroups which are programmed in. It shoud also exclude any which are Locked out.

In “Search”, Scanner will pick up All Talkgroups, except Programmed Talkgroups which have been temporarily or permanently Locked out. My practice has been to Programme in all the Talkgroups I know of and then Lock out the ones I don’t want. I prefer using “Search” over “Scan” ‘cos it will pick up any new Talkgroups as they occur. Hope this helps. Bill Lauchlan

Subject: [BCD396XT] Question regarding digital noise on trunked system.

Hello all!

I will start off by admitting that I just purchased my BCD 396XT a week or so ago. I do, however, have some experience with digital scanners (I own a Pro-197) and despite this, and my own research, I cannot resolve this ongoing problem.

Basically, I live in Orange County, CA and I am trying to monitor the Countywide Coordinated Communication System (See https://www.radioreference.com/apps/db/?sid=201) which consists of analog (Fire/EMS), digital-encrypted (Police), City Interoperability (Digital), and the RED channel for major incidents (Digital). I have programmed these frequencies via FreeScan and excluded encrypted frequencies. Despite this, I receive interference from unprogrammed talkgroups that consist of a digital garbling noise. For other unprogrammed talkgroups it is simply quiet, thus the scanner gets stuck on a channel with no audible activity. I believe these are encrypted frequencies but I may be wrong. Either way, I do not receive this interference on my Pro-197.

Again, I have researched this problem to no avail, but I am a novice. Could anyone offer any assistance or ideas? I have already tried locking out non-control channels but this has not worked. Is there any way I can program the scanner to exclude any non-programmed talkgroups? If necessary, I can upload the FreeScan file somewhere.

Thanks in advance for any assist you can provide!

Bill:

That totally answers my noob question. I can see how search would be advantageous however pretty much all of the law enforcement radio traffic is encrypted here so you end up with a lot of garbled digital noise

Thanks again for your assistance, the more I learn how to use this scanner, the more I enjoy it. I can’t wait for a trip to LA so I can get some police traffic.

Have a great day,

Miles Madison

IIRC the Uniden digital trunking scanners automatically mute on P25 encrypted talkgroups. It is possible that some data other than encrypted traffic is being transmitted on a talkgroup which is being picked up in ID Search which will stop on any active talkgroup. Using ID Scan will restrict scanning to the programmed talkgroups that are not locked out.

What you *could* do is to program in all the encrypted TGs, then lock them out. Tat way, even ID SEARCH will not stop on them. That will allow you to effectively search for new TGs.

sorry for short notice, but there is one hour left on an amazon today's deals or lightning deals for the 396xt at what seems like an attractive price although i haven't kept up with pricing lately:

http://amzn.to/1pfY2LI

btw, yahoo is hosed beyond belief, both the website and the email relay capability. hope this makes it through in time to benefit someone.

Yes, this a good deal providing one can figure out how to operate it.
I recently had speaker issues and thank god I had a warranty because the RS
Representative told me it cost $50 more now than a couple of years ago when
I bought it I got the radio and a 2 yr warranty and spent $550 I don't see
how that could even be remotely possible but at any rate I got a new unit.
even the $380 price is good just don't forget S/H and the possibility of
tax.

i've owned this one and its predecessor for nearly 10 years and i'm still in mortal fear of pressing any buttons other than /scan/ or /on-off/ mark. the firmware and user interface is absolutely brilliant given the number of buttons--there just aren't near enough buttons. and modes are the devil's handiwork and this one has seemingly dozens of modes and sub-modes where the buttons operated differently than in scan mode.

Factory reset:

1. Turn off your scanner

2. Hold down the following keys at the same time.

2, 9, and hold

3. While holding down those three buttons, power the unit on

You need a program like ARC or Freescan that know the proper commands to read the radio's programming and convert that into a file (s) that ARC or Freescan can use to let you change or update the programmed frequencies, systems and groups.

There are no "files" on the radio.

I'm guessing you mean LTR (logic trunked radio) Those systems aren't too bad to program even manually so you'll probably be OK. I haven't looked at what systems are in your area on the RR DB but unless it's P-25 Phase II or X-2 TDMA or a proprietary type of mode you'll be good to go with the 396XT even in a rural area especially if you're higher in altitude. This group is very friendly and I'm sure you'll find any help you need when get your 396!

The Maryland State Police currently use low band in your area. However they are building out the next section of their statewide 700/800 MHz P25 Phase 2 digital trunked system. Phase 2 P25 uses TDMA modulation and cannot be monitored using a 396XT which is only capable of listening to P25 Phase 1.

Depends on where you are in Far Western MD (Garrett, Allegheny, and Washington Counties).

As far as I know Garrett is still on low band 33Mhz.

Allegheny was on low band 33 MHz and has been playing around over the last few years with various configurations on UHF. The current appears to be a Passport LTR system on UHF which is not able to be tracked with any scanner.

Washington was on low band 33MHz but moved to a UHF P25 Phase 1 digital system that is simulcast from multiple sites.

The Maryland State Police currently use low band in your area. However
they are building out the next section of their statewide 700/800 MHz
P25 Phase 2 digital trunked system. Phase 2 P25 uses TDMA modulation
and cannot be monitored using a 396XT which is only capable of listening
to P25 Phase 1.
Thanks, for input. I listen to Garrett County (where I am locate) Sherrifs (may have moved freq); Maryland State Police Mchenry barracks, WISP Ski area; GC Roads Dept in Winter; Parks DNR & NRP police & EMS (911) dispatch. Eithr hospital or ambalance has one to Narrow Band FM & only get a few words!
MSP are on 39 MHZ. Hear say locally says the police are now testing on 700-800 Mhz (Mc). Bought a BCD396XT on Ebay last night.

Dick W1DGa in Swanton MD

Depends on where you are in Far Western MD (Garrett, Allegheny, and
Washington Counties).

As far as I know Garrett is still on low band 33Mhz.

Allegheny was on low band 33 MHz and has been playing around over the
last few years with various configurations on UHF. The current appears
to be a Passport LTR system on UHF which is not able to be tracked with
any scanner.

Washington was on low band 33MHz but moved to a UHF P25 Phase 1 digital
system that is simulcast from multiple sites.

It is an LTR system, which can be monitored with a BCD396XT, but despite having been in the database for years (last update to it was in 2010), there are no documented channels in use on the system. Perhaps the system is being converted over to some other system, but no mention that I can find in the database. You might check the state discussion forum at RadioReference to see if a local has some other informmation on it.

There are 3 display modes. Press hold on any talk group or frequency then press 'function' then '6' and that key sequence will toggle between the 3 modes.

Hi, I am abt to clean out previous owners programing. Will load stations by had if need to, but as I have a cord with large plug end, assuming its for PC? Assuming PC, there is likely a way to enter stations & info via PC? Likely similar to a Ham Chineese handheld? I know its working as I can hear a past programing freq that happens to match the police in next county! I did not get a CD with unit, did it have the S/W? Is S/W on line?

Dick,
Google 'Free Scan' and download/install it to your PC.
Then check radiorefernce.com for the frequencies/groups in your area.

I just bought a bcd396xt and took it to a local RS and they programmed the areas I wanted in the scanner. How do I change from one area to another. I thought I could hit menu, then program and hit scan to switch. So if im on one group like state police and want to go to a different, what do I do? Its on state police now and want to switch to my local town police which is programmed in the scanner but I don't know how to make it scan.

Thank You

If I understand what you are asking you simply twist the dial one click to be in the next area. Of course if you push it down one detent and twist once you will increase the volume. What I have never understood is if there is a way to scan through all the frequencies all the time.

Take the cable and use a software and upload your scanner to it then you will be able to see how it was programmed then you can ask how to do it.
1~99 are keys that can just be pushed when the radio is on 11~00 needs to have the .no button pushed first.
0~9 are the Group Keys and you will have to push function first.
